But never has the experience of space flight seemed as physical, as visceral or indeed as brutal as it does in *First Man*. To be fair, at times, one could be forgiven for mistaking *First Man* for science fiction. Particularly the final sequence of the actual Apollo 11 moon landing spoilers? The image of the vast unspoiled lunar landscape, punctuated by a small moving point of light falling towards it, would not be out of place in many a science fiction masterpiece. But most of the film dispenses with the tropes of glory shots and stately moving man-made objects in space in exchange for a radical subjectivity that shows us the experience through the eyes of the men who took the risk. Every rivet and bolt is lingered over, and the audience is invited, not to their comfort, to contemplate how hand-made and relatively low-tech these supposed marvels of engineering really were. It took real bravery for people to put their lives in the hands of such machines, but people did, and while adventure was certainly part of it, they also knew they were making history. Risk was a necessary part of the process. Not in financial terms, of course although a scene in Washington portrays the penny-pinching pearl-clutchers as the petty and shortsighted politicians they were, but in human lives. The film takes pains to flesh out two astronauts who are rarely featured in popular re-tellings of those times: In fact, the film is framed by personal loss. The distraction is the illness of his two-year-old daughter Karen, dying very quickly from a brain tumor that would be challenging to treat today, but all but impossible to remedy in 1968. After her death he sobs uncontrollably in private, but is soon back to work. This motif is repeated throughout the film, with the losses and grieving piling up behind the whole program. But rather than slow or discourage the astronaut, each loss is treated more as a sacrifice to a great Mammon, each propelling him and the program faster towards the ultimate goal, that elusive sphere in the sky. While the world cheers and celebrates the landing at the end, for Armstrong it becomes an occasion for tears, remembering the cost of getting him to where he is. The scene in which she forces her husband to explain to their sons what he is about to attempt, the night before he leaves for NASA to begin his mission to the moon, is almost as harrowing as the flight of the X Younger son Mark asks questions, to which Armstrong responds, running the meeting as if it were taking place in a corporate boardroom. Older son Rick, more aware of what was about to happen and the chances of never seeing his father again, simply stares, an expression borrowed from his formidable mother, and rather than crying or hugging his father, coolly shakes his hand. In reality, just about all of the astronauts were fathers and husbands, and many left behind a grim trail of widows and orphans in the wake of their adventures. Not to mention all of the broken marriages. Apollo had a personal cost to many families, and the film reminds us of that. But *First Man* is, more than anything else, a physically absorbing experience. It grabs the audience and refuses to let it go. The final shots, again without dialogue, leave whatever resolution or catharsis the drama earns in the hands of the audience. Any film to which that label can be applied deserves to be celebrated, and seen.

Visit Website The first, known as the Calendar Round, was based on two overlapping annual cycles: Under this system, each day was assigned four pieces of identifying information: Every 52 years counted as a single interval, or Calendar Round. After each interval the calendar would reset itself like a clock. Because the Calendar Round measured time in an endless loop, it was a poor way to fix events in an absolute chronology or in relationship to one another over a long period. For this job, a priest working in about BC devised another system: The Long Count system identified each day by counting forward from a fixed date in the distant past. It grouped days into sets, or cycles, as follows: One Grand Cycle was equal to 13 baktuns, or about 5, solar years. At sunset on these two days, the pyramid casts a shadow on itself that aligns with a carving of the head of the Mayan serpent god. **Mayan Technology Remarkably**, the ancient Maya managed to build elaborate temples and great cities without what we would consider to be essential tools: For example, they built complicated looms for weaving cloth and devised a rainbow of glittery paints made from mica, a mineral that still has technological uses today. Until recently, people believed that vulcanizationâ€”combining rubber with other materials to make it more durableâ€”was discovered by the American from Connecticut Charles Goodyear in the 19th century. However, historians now think that the Maya were producing rubber products about 3, years before Goodyear received his patent in How did they do it? Researchers believe that the Maya discovered this process accidentally, during a religious ritual in which they combined the rubber tree and the morning-glory plant. Once they realized how strong and versatile this new material was, the Maya began to use it in a variety of ways: The cause and scope of the decline is a matter of some debate today. Some believe that the Maya were wiped out by war, while others attribute their demise to the disruption of their trade routes. While much of what was left of the ancient Maya culture was subsumed by the Spanish conquistadors in the 16th century, the legacy of Mayan scientific achievement lives on in the discoveries that archeologists continue to make about this amazing ancient culture.
