Since this board is the entry level board in the AI7 series, only a minimal of items are included with the board, including: Everything on the board has adequate space so as to not get in the way of other components, as well as some unique implementation decisions as well. The board under scrutiny is very clearly a revision 1. Note that all capacitors used for the board are manufactured by the noted Japanese semiconductor manufacturer Rubycon. The CPU socket area is fully clear of obstructions, allowing for easy installation and removal of a HSF unit using the stock P4 retention cage. Note that unusual orientation of the CPU socket itself. This orientation was most likely implemented for better power delivery to the CPU and to increase system stability while under heavy load. The Northbridge HSF unit itself is held to the board by a length of wire fixed to two loops on opposite sides of the chipset. This location is good for power feed length to the CPU, but could pose some cable routing issues. The slots themselves are grouped in two sets of two, with each socket with a set color coordinated with a slot from the other set, to ease in enabling Dual Channel memory mode. ABIT positioned the slots themselves to that a seated AGP card does not interfere with memory installation or removal. With the budget nature of this board, the onboard diagnostic LED is a very nice addition, especially in light of the fact that very few motherboard manufacturers outside of EPOX include them onboard. The uGuru chipset allows for hardware control and monitoring of the board via the Windows based uGuru application suite. The front panel connector is in the lower left corner of the board, with the floppy connector above it along the left edge of the board as well. Note that there are spots on the board for an additional SATA controller and additional SATA ports, which are not included with this version of the board. The AI7 has the following items integrated in to its rear panel: The suite of applications work in tandem with the onboard uGuru chipset to receive data concerning hardware health, as well as to implement changes in current hardware settings such as FSB and voltage. The suite is broken in to a series of six applets: Note that settings are not applied until the Apply button is selected. One other feature offered is the ability to save selected settings under customized naming schemes. The interface allows for full customization through the Monitor Settings and the Display Settings windows. In the Monitor Settings window, you can select upper and lower thresholds for all monitored items as well as the system response, such as system shutdown. The Display Settings window allows you to customize what monitors display in the main interface and how and where they display within the interface. For each fan header, you are able to set a reference temperature based on the BIOS monitored temperatures available and the fan operation mode. This BlackBox feature basically simplifies the technical support process in that it collects all critical hardware and software information needed from your system to help diagnose the issue. This way, all you have to focus on is telling support about the issue you are having instead of listing 3 pages of system specs.
