The risk management plan evaluates identified risks and outlines mitigation actions. A risk management plan should be periodically updated and expanded throughout the life cycle of the project, as the project increases in complexity and risks become more defined. Risk management ideally takes a project throughout the phases of risk identification, risk assessment and risk resolution. With the advancement in project management studies and techniques, risk management has taken a main place in the project life cycle ; in most cases at the outset of the project itself. The risk management plan should be a part of your overall project plan. The risk plan for smaller projects can be as simple as a risk management matrix. Complex projects require more thorough risk analysis and planning. For each risk outlined in the risk matrix you will want to create a thorough analysis for each. The main goal of creating the risk matrix is to prioritize your risks. You will never be able to eliminate all risk, but you can prioritize and document risks to attempt to mitigate or eliminate them. The risk management matrix will document the following items: What risks can be associated with this project? Will the risks affect the schedule, resourcing or budget? Probability - the table should contain a probability of the risk occurring. This can be a percentage or a number. Impact - what is the impact to the project if the risk should occur? Build a scale appropriate for the project - smaller projects can use a simple impact of minimal to major whereas larger projects may want a more formal scale. Higher priority items should be mitigated and planned for before lower priority items. Mitigation Response - a brief overview of mitigation steps to eliminate or reduce the risk. The columns will be named after each of the five items in the previous section. The first column can simply be an ID column.
