In lieu of an abstract, here is a brief excerpt of the content: Holland As I look back, it seems to me that two discoveries shaped my intellectual life and career. The first was the New Criticism. It was in a poetry study group led by the poet Cid Corman that I found I had a peculiar knack for this method of reading texts. As I practiced it, the aim was to show how all the parts and aspects of a poem or story fit together into one organic unity. The method consisted in grouping details of the text into thematic clusters: Then one grouped those clusters into larger themes: Finally, I would bring all these themes together in a statement of a single unifying theme for the play, say, corruption as the failure to bring words and deeds together. Then one could go back down to the details of Hamlet. One could show how any given sentence related through one or more themes to the central core of the organic whole. This was the so-called New Criticism and, I would say, European structuralism as well. No doubt I am over-simplifying structuralism, as is my fatal habit. Nevertheless, it seems to me that if you strip the philosophy off, what you are left with is this method of reading texts for an organic unity. The method in turn is called by philosophers holistic method, and it is a well-recognized method. You see it somewhat in the natural sciences, for example, astronomy or geology. The greatest geological discovery of this century, the theory of plate tectonics, [End Page ] consisted of putting together into a coherent picture evidence from a variety of sources, the study of earthquakes, of the reversals of the magnetic pole, the fact that South America can be fitted into Africa, and so on. Mostly, however, you see holistic method in the social sciences. You see it in clinical psychology, anthropology, geography, criminology, and, of course, in literary criticism, which I would describe as one of the social sciences. I could do New Criticism easily, convincingly, and well, and I liked doing it. I was delighted to find that journals would publish what I wrote, and my department rewarded my publications. And I found a small but passionate group of scholars in the field who welcomed a young and energetic newcomer: Leonard and Eleanor Manheim, who published the tiny journal, *Literature and Psychology*; Simon Lesser, author of *Fiction and the Unconscious*; Norman Kiell, who assembled the extraordinary bibliography for our field. Always something of a rebel, I came to believe passionately in this way of reading. I thought this method of reading loosened the grip of the authorities, the professors who knew all the questionable facts of literary history. New Criticism democratized literature. It opened the wonderful texts of English literature to ordinary students and readers. No longer were the great texts only for those of cultured, wealthy backgrounds. New Criticism seemed to me a high point in Western writing about literature. It still seems so to me, even after several decades of reaction and discrediting. Yes, even though later critics have proved the assumptions of New Criticism wrong, in my eyes, too. We were mistaken, but we did good work, given our premises. It was a way of admiring and respecting even the humblest works. My friends and I used to have a lot of fun analyzing B movies this way, as the Cahiers critics were doing at the same time. One looked at all of the movie or poem or novel at once. One showed how it had a wholeness, much as one might look at a painting or sculpture or a piece of music. I felt skilled and powerful doing New Criticism. I was teaching Shakespeare in those days, and I used to challenge [End Page ] my students in my classes. Pick any five consecutive words from a play. *Books by Punch, Mr. Punch's History of the Great War, Coping with Corruption (SMP Cahier).*

Download Chrome for Linux Please select your download package: There may be a community-supported version for your distribution here. Source code for Google Chrome is available free of charge under open source software license agreements at <https://www.chromium.org/developers/how-to-contribute>: Your relationship with Google 1. This document explains how the agreement is made up, and sets out some of the terms of that agreement. Open source software licenses for Google Chrome source code constitute separate written agreements. To the limited extent that the open source software licenses expressly supersede these Universal Terms, the open source licenses govern your agreement with Google for the use of Google Chrome or specific included components of Google Chrome. Where Additional Terms apply to a Service, these will be accessible for you to read either within, or through your use of, that Service. It is important that you take the time to read them carefully. Accepting the Terms 2. You may not use the Services if you do not accept the Terms. A clicking to accept or agree to the Terms, where this option is made available to you by Google in the user interface for any Service; or B by actually using the Services. In this case, you understand and agree that Google will treat your use of the Services as acceptance of the Terms from that point onwards. Language of the Terms 3. Provision of the Services by Google 4. Sometimes, these companies will be providing the Services to you on behalf of Google itself. You acknowledge and agree that Subsidiaries and Affiliates will be entitled to provide the Services to you. You acknowledge and agree that the form and nature of the Services which Google provides may change from time to time without prior notice to you. You may stop using the Services at any time. You do not need to specifically inform Google when you stop using the Services. Use of the Services by you 5. Privacy and your personal information 6. This policy explains how Google treats your personal information, and protects your privacy, when you use the Services. Content in the Services 7. You may not modify, rent, lease, loan, sell, distribute or create derivative works based on this Content either in whole or in part unless you have been specifically told that you may do so by Google or by the owners of that Content, in a separate agreement. For some of the Services, Google may provide tools to filter out explicit sexual content. These tools include the SafeSearch preference settings see <https://www.google.com/preferences>: In addition, there are commercially available services and software to limit access to material that you may find objectionable. These guidelines can be viewed online at <https://www.google.com/ads/preferences/>: Unless you have agreed otherwise in writing with Google, you agree that you are responsible for protecting and enforcing those rights and that Google has no obligation to do so on your behalf. License from Google 9. This license is for the sole purpose of enabling you to use and enjoy the benefit of the Services as provided by Google, in the manner permitted by the Terms. Content license from you These updates are designed to improve, enhance and further develop the Services and may take the form of bug fixes, enhanced functions, new software modules and completely new versions. You agree to receive such updates and permit Google to deliver these to you as part of your use of the Services. Ending your relationship with Google Copyright and trade mark policies These advertisements may be targeted to the content of information stored on the Services, queries made through the Services or other information. Google may have no control over any web sites or resources which are provided by companies or persons other than Google. Changes to the Terms When these changes are made, Google will make a new copy of the Universal Terms available at <https://www.google.com/policies/terms/>: General legal terms Your use of these other services, software or goods may be subject to separate terms between you and the company or person concerned. If so, the Terms do not affect your legal relationship with these other companies or individuals. The remaining provisions of the Terms will continue to be valid and enforceable. Other than this, no other person or company shall be third party beneficiaries to the Terms. You and Google agree to submit to the exclusive jurisdiction of the courts located within the county of Santa Clara, California to resolve any legal matter arising from the Terms. Notwithstanding this, you agree that Google shall still be allowed to apply for injunctive remedies or an equivalent type of urgent legal relief in any jurisdiction. Additional Terms for Extensions for Google Chrome Extensions are small software programs, developed by Google or third parties, that can modify and enhance the functionality of Google Chrome.

Extensions may have greater privileges to access your browser or your computer than regular webpages, including the ability to read and modify your private data. You agree that such updates will be automatically requested, downloaded, and installed without further notice to you. You agree that Google may remotely disable or remove any such extension from user systems in its sole discretion. Additional Terms for Enterprise Use

Sublicensee may not modify or distribute this Adobe Software for use as anything but a browser plug-in for playing back content on a web page. For example, Sublicensee will not modify this Adobe Software in order to allow interoperation with applications that run outside of the browser e. For clarification purposes, the foregoing restriction does not preclude Sublicensee from distributing, and Sublicensee will distribute the Adobe Software as bundled with the Google Software, without charge. Sublicensee shall not, and shall require its distributors not to, delete or in any manner alter the copyright notices, trademarks, logos or related notices, or other proprietary rights notices of Adobe and its licensors, if any appearing on or within the Adobe Software or accompanying materials. Sublicensee Product that has not passed verification may not be distributed. Profiles and Device Central. Sublicensee will be prompted to enter certain profile information about the Sublicensee Products either as part of the Verification process or some other method, and Sublicensee will provide such information, to Adobe. Sublicensee acknowledges that the laws and regulations of the United States restrict the export and re-export of commodities and technical data of United States origin, which may include the Adobe Software. Sublicensee agrees that it will not export or re-export the Adobe Software, without the appropriate United States and foreign governmental clearances, if any. The Adobe Software may be used for the encoding or decoding of MP3 data contained within a swf or flv file, which contains video, picture or other data. Sublicensee shall acknowledge that use of the Adobe Software for non-PC devices, as described in the prohibitions in this section, may require the payment of licensing royalties or other amounts to third parties who may hold intellectual property rights related to the MP3 technology and that Adobe nor Sublicensee has not paid any royalties or other amounts on account of third party intellectual property rights for such use. If Sublicensee requires an MP3 encoder or decoder for such use, Sublicensee is responsible for obtaining the necessary intellectual property license, including any applicable patent rights. All codecs provided with the Adobe Software may only be used and distributed as an integrated part of the Adobe Software and may not be accessed by any other application, including other Google applications. Sublicensee acknowledges and agrees that Adobe is not providing a patent license for an AAC Codec under this Agreement to Sublicensee or its sublicensees. Attribution and Proprietary Notices. Sublicensee will list the Adobe Software in publicly available Sublicensee Product specifications and include appropriate Adobe Software branding specifically excluding the Adobe corporate logo on the Sublicensee Product packaging or marketing materials in a manner consistent with branding of other third party products contained within the Sublicensee Product. Content Protection Terms a Definitions. Sublicensee and customers may only distribute the Adobe Software that meets the Robustness and Compliance Rules as so confirmed by Sublicensee during the verification process described above in the Adobe Terms. Sublicensee shall not i circumvent the Content Protection Functions of either the Adobe Software or any related Adobe Software that is used to encrypt or decrypt digital content for authorised consumption by users of the Adobe Software or ii develop or distribute products that are designed to circumvent the Content Protection Functions of either the Adobe Software or any Adobe Software that is used to encrypt or decrypt digital content for authorised consumption by users of the Adobe Software. Sublicensee agrees that a breach of this Agreement may compromise the Content Protection Functions of the Adobe Software and may cause unique and lasting harm to the interests of Adobe and owners of digital content that rely on such Content Protection Functions, and that monetary damages may be inadequate to compensate fully for such harm. Therefore, Sublicensee further agrees that Adobe may be entitled to seek injunctive relief to prevent or limit the harm caused by any such breach, in addition to monetary damages. Sublicensee must have an agreement with each of its licensees, and if such licensees are allowed to redistribute the Adobe Software, such agreement will include the Adobe Terms. Installing Google Chrome will add the Google repository so your system will automatically keep Google Chrome up to date. Set Google Chrome as my default browser Help make Google Chrome better by automatically sending usage statistics and crash reports to Google. Learn more Accept and Install.

**Chapter 5 : How Best to Respond to Ethical Challenges in Business | IFAC**

*Corruption is considered to be dangerous, since it potentially threatens the integrity of society. It is a complex phenomenon, difficult to prevent. Every other year, recent developments are discussed in the International Anti-Corruption conference.*

Their tools, including scrapers, chisels and arrowheads, were discovered in through archaeological excavations. The cavalry of the Mossi Kingdoms were experts at raiding deep into enemy territory, even against the formidable Mali Empire. During the Middle Ages the Mossi established several separate kingdoms including those of Tenkodogo, Yatenga, Zandoma, and Ouagadougou. Please help improve this article by adding citations to reliable sources. Unsourced material may be challenged and removed. December Learn how and when to remove this template message Starting in the early s a series of British, French and German military officers made attempts to claim parts of what is today Burkina Faso. At times these colonialists and their armies fought the local peoples; at times they forged alliances with them and made treaties. The colonialist officers and their home governments also made treaties amongst themselves. Through a complex series of events what is Burkina Faso eventually became a French protectorate in By, the majority of the territory corresponding to Burkina Faso was nominally conquered; however, French control of many parts remained uncertain. In the French territory, a war of conquest against local communities and political powers continued for about five years. In, the largely pacified territories of the Volta basin were integrated into the Upper Senegal and Niger colony of French West Africa as part of the reorganization of the French West African colonial empire. The colony had its capital in Bamako. The language of colonial administration and schooling became French. The public education system started from humble origins. Advanced education was provided for many years during the colonial period in Dakar. Draftees from the territory participated in the European fronts of World War I in the battalions of the Senegalese Rifles. Between and, the districts in the western part of what is now Burkina Faso and the bordering eastern fringe of Mali became the stage of one of the most important armed oppositions to colonial government: It also had to organize its largest expeditionary force of its colonial history to send into the country to suppress the insurrection. Armed opposition wracked the Sahelian north when the Tuareg and allied groups of the Dori region ended their truce with the government. The French feared a recurrence of armed uprising and had related economic considerations. To bolster its administration, the colonial government separated the present territory of Burkina Faso from Upper Senegal and Niger. Hesling initiated an ambitious road-making program to improve infrastructure and promoted the growth of cotton for export. The cotton policy "based on coercion" failed, and revenue generated by the colony stagnated. Ivory Coast received the largest share, which contained most of the population as well as the cities of Ouagadougou and Bobo-Dioulasso. France reversed this change during the period of intense anti-colonial agitation that followed the end of World War II. The French designated its colonies as departments of metropolitan France on the European continent. This act was followed by reorganization measures approved by the French parliament early in to ensure a large degree of self-government for individual territories. Full independence from France was received in These were expressed in the three colors of the former national flag. The constitution provided for election by universal suffrage of a president and a national assembly for five-year terms. The government lasted until After much unrest, including mass demonstrations and strikes by students, labor unions, and civil servants, the military intervened. The army remained in power for four years. On 14 June, the Voltans ratified a new constitution that established a four-year transition period toward complete civilian rule. Lamizana remained in power throughout the s as president of military or mixed civil-military governments. After conflict over the constitution, a new constitution was written and approved in Lamizana was re-elected by open elections in Saye Zerbo overthrew President Lamizana in a bloodless coup. Colonel Zerbo established the Military Committee of Recovery for National Progress as the supreme governmental authority, thus eradicating the constitution. Colonel Zerbo also encountered resistance from trade unions and was overthrown two years later by Maj. The CSP continued to ban political parties and organizations, yet promised a transition to civilian rule

and a new constitution. The leader of the leftists, Capt. Efforts to free him, directed by Capt. The Pioneers of the Revolution youth programme was also established. Sankara launched an ambitious socioeconomic programme for change, one of the largest ever undertaken on the African continent. His domestic policies included a nationwide literacy campaign, land redistribution to peasants, railway and road construction and the outlawing of female genital mutilation , forced marriages and polygamy. Sankara called on every village to build a medical dispensary and had over communities build schools with their own labour. October protests[ edit ] Main article: Later in the day, the military dissolved all government institutions and set a curfew. Isaac Zida said that he would lead the country during its transitional period before the planned presidential election but there were concerns over his close ties to the former president. Zida became the acting Prime Minister and Defense Minister.

**Chapter 6 : Google Chrome Web Browser**

*Corruption among public servants in india, corruption among public servants has always existed in one form or the other although its shape, dimensions, textures and shades have been changing from time to time and place to place.*

The invention relates more specifically to techniques for activating virtualized computer applications. Therefore, unless otherwise indicated herein, the approaches described in this section are not prior art to the claims in this application and are not admitted to be prior art by inclusion in this section. Network administrators seek to protect network equipment and software from harm inflicted by defective or malicious systems or applications. A corrupted application or operating system on a host in the network, considered alone, typically is not considered a problem. However, the corrupted application or operating system becomes an issue if the corruption results in infecting other systems or poisoning data, or prevents the operating system from running properly and from properly supervising or hosting applications. Trusted software agents, embedded in an operating system, can be used to scan local systems for policy violation conditions, and can use information obtained in the scans to make decisions about enabling communications over the network. A network device may be more trusted or less trusted based upon where the device has connected to the network and what software or data has been loaded onto the device. For such devices, the security of a trusted software agent approach depends upon the quality of the protection mechanisms implemented in the agents. A sufficiently determined attacker may be able to overwhelm the protection mechanisms of the agents from within the operating system, thereby corrupt the running operating system and the systems connected to it. Vulnerable operating systems exposed on the Internet are known to be susceptible to attack on ever decreasing time scales. Additionally, applications are increasingly bound to particular versions of the operating system upon which they run. This binding often includes various versions of the kernel and patches of both the OS and applications. Some of the bindings impact security; others may affect application functionality, and in some cases the bindings affect both security and functionality. Even when vulnerabilities of applications and operating systems are known and patches are available, side effects of applying the patches or other remediation steps may make taking protective actions or performing the remediation less desirable to a network or server administrator than coping with the infection. In the following description, for the purposes of explanation, numerous specific details are set forth in order to provide a thorough understanding of the present invention. It will be apparent, however, to one skilled in the art that the present invention may be practiced without these specific details. In other instances, well-known structures and devices are shown in block diagram form in order to avoid unnecessarily obscuring the present invention. Embodiments are described herein according to the following outline: In one feature, the vulnerability monitoring agent is coupled to a re-imaging system, the re-imaging system is coupled to a repository of copies of applications and operating systems, and the vulnerability monitoring agent is further configured to detect that the application program or the operating system is corrupted, to remove the application program or operating system from the controlled execution space, and to request the re-imaging system to re-image the controlled execution space with a new copy of the application program and the operating system. In another feature, the vulnerability monitoring agent is further configured to generate a first digital signature based on one or more components or data sets associated with the application program and operating system, to retrieve a trusted second digital signature, and to determine whether the first digital signature matches the second digital signature. In yet another feature, the vulnerability monitoring agent is coupled to a shared data repository and a re-imaging system, the re-imaging system is coupled to a repository of copies of applications and operating systems, and the vulnerability monitoring agent is further configured to detect that the application program or the operating system is corrupted, to store data both static data and dynamic run time states associated with the application program or the operating system in the shared data repository, to remove the application program or operating system from the controlled execution space, and to request the re-imaging system to re-image the controlled execution space with a new copy of the application program and the operating system and restore the saved data. In still another feature, a management domain controller is coupled to the vulnerability monitoring agent

over a network, and the management domain controller is configured to control access to the vulnerability profiles. In yet another feature, the controlled execution space comprises a virtual machine monitor. In a further feature, the vulnerability monitoring agent, controlled execution space, application program, and operating system are in a first computer, and the vulnerability profiles are in a second computer that is coupled to the first computer over a network. In a related feature, a plurality of instances of the vulnerability monitoring agent are provided, each of the instances is hosted on one of the processor elements for example, a core on multi-core processors, and each of the instances is configured to communicate information about detected vulnerabilities to other instances over one or more arbitrated socket connections. In other aspects, the invention encompasses a computer-implemented method and a computer-readable storage medium comprising logic that implements one or more of the above features. One or more operating systems OS and corresponding applications OS-applications execute in a plurality of controlled execution spaces. The OS and OS-applications are monitored using a monitoring agent. The system stores vulnerability profiles that specify known vulnerabilities of each combination of an OS and set of OS-applications running on top of it. In response, the system can impose restrictions on application activation or action based on the vulnerability profiles. Restrictions may comprise prohibiting access or bandwidth consumption, imposing restricted network connectivity or network isolation through traffic restrictions or port limitations, restricting or blocking OS system calls, and other restrictions. Further, in response, the system can erase corrupt software images of the OS and OS-applications along with generated data, and can extract and start up a new copy of the OS and OS-applications along with sanitized data. In one embodiment, an operating system and OS-applications are run and monitored in an execution isolation system by using a Virtual Machine Monitor VMM which allocates memory and controls the computer and networking resources to run images on virtual machines. An execution isolation system may provide multiple controlled execution spaces. For example, a plurality of virtual machines may be used as the controlled execution space. The MDC contains policies for interpreting computational and network requirements and forming instructions for resource allocation. A VP associates information identifying the OS, information identifying the OS-applications, information identifying anomalies of particular combinations of an OS and a set of OS-applications, and policy-based actions that can be applied to mitigate problems. The actions can be applied in the configuration of resources by the VMM. For example, if vulnerabilities are known for a particular combination of OS and application set versions, then the configuration and other properties of the combination can be tailored to minimize their impact. Specific examples include limiting the total running time or port configurations, or introducing write permissions. Alternatively, the actions can be applied dynamically as anomalies are detected or anticipated. In one embodiment, a VP specifies one or more characteristics and one or more vulnerabilities of an OS and OS-applications. Vulnerabilities may include, for example: In response to detecting a vulnerability, the system can impose numerous kinds of restrictions on application activity. Example restrictions include prohibiting access to network resources; restricting bandwidth consumption by throttling traffic rate; achieving sub network connectivity restrictions or isolation by allowing applications traffic restrictions, port limitations, and OS system calls. For example, when an anomaly or corruption is detected, operations of the OS are restricted using system call monitors. As another example, the types of communication allowed over the network are limited. As another example, the OS-applications are surveyed for errors in running processes that may require checkpointing the data of the running image and starting up a new copy of the running image. As another example, a responsive restriction may comprise extracting potentially corrupt data files, running the files through a scrubber to eliminate corruption, and then feeding the files to the restored OS and application set. In this case, the data is cleaned as well as the OS and applications. In an embodiment, only the data is scrubbed, as the OS and applications are not contaminated. In one embodiment, if corruption of a running image is detected, then a re-imaging system reconstitutes the running image of an OS-application within the virtual machine or VMM-isolated domain, to provide a correct clean image hosted in a SAN or local disk. If re-imaging the OS-application is required, then a copy of data previously created by the corrupt OS system and application is removed and stored in a data repository. When the correct clean image of the OS system and OS-application has been obtained, the stored data is retrieved from the repository and re-inserted into the new

clean image. The corrected image is then restarted. Thus, if there is a known relevant context for the vulnerability then it may be side stepped through monitoring software that inhibits such operations while permitting other mission critical operations to proceed. Operating systems and applications executed by the host computer within the execution isolation system are the subject of monitoring and restriction or remediation using the techniques herein. The network may comprise a local area network, wide area network, internetwork, or a combination thereof. Re-imaging system and a management domain controller may be coupled to host computer using the network. The execution isolation system comprises a vulnerability monitoring agent coupled to one or more controlled execution spaces A, B. Each of the controlled execution spaces A, B hosts an application and operating system, collectively denoted A, B. There may be any number of execution spaces A, B in the execution isolation system. The vulnerability monitoring agent is coupled to management domain controller, which is coupled to vulnerability profiles. The vulnerability monitoring agent receives instructions for monitoring and policy-based actions from the management domain controller. The management domain controller receives operational information about the OS-applications A, B running within the execution isolation system from the vulnerability monitoring agent. The vulnerability monitoring agent relies on the one or more vulnerability profiles to supervise the OS-applications A, B within the controlled execution spaces A, B. In an embodiment, vulnerability profile comprises information associating characteristics and known vulnerabilities of the operating systems and applications that execute in execution isolation system. For example, vulnerability profile comprises, for each combination of an OS and OS-application, information identifying mechanisms the OS and OS-applications potentially use to spread corruption, the effects of data poisoning and the viability of a running image over time. Additionally the vulnerability profile comprises policy-based actions that can be applied to mitigate problems, clean up problems or restrict actions either in the configuration of resources or during operation of an OS or OS-application. In an embodiment, vulnerability profile is structured as a data table having an application column, operating system column, and vulnerability column. The application column stores identifiers of OS-applications. The operating system column stores identifiers of operating systems that the OS-applications execute under. Each application identified in application column may be associated with multiple different operating systems identified in column; thus, column may have duplicate entries. The vulnerability column identifies one or more vulnerabilities of the combination of an application and operating system that appear in the same row as a particular vulnerability entry. Thus, for each of the applications and operating systems, one or more associated vulnerabilities are stored and maintained. In an embodiment, an XML-based profile structures vulnerability information and related policies. Examples of vulnerabilities include a memory leak as indicated in table entry, entering too many records causes page faults as in entry, and attempts to establish connection using prohibited peer-to-peer protocol on port as in entry. The values shown in FIG. In an embodiment, vulnerability profile further comprises a policy column that identifies responsive policies or restrictions that the system should impose when the indicated vulnerability is detected. Alternatively, policies or restrictions may be stored in management domain controller. The management domain controller monitors the host computer to determine whether the operating systems and associated applications are operating properly, or are corrupted, or have generated anomalies. In one embodiment, the management domain controller runs on the host computer. In another embodiment, the management domain controller executes on a particular processor core of the host computer. Alternatively, the management domain controller may be hosted on a separate computer. Further, the management domain controller may first operate on the host computer and then migrate to a separate computer when the host computer is under threat, or to provide services that consume more resources than the processor of the host computer can provide. The management domain controller communicates with the execution isolation system. The execution isolation system manages communication to OS-applications A, B and operating systems. The execution isolation system can implement restrictive actions on any of the operating systems. Alternatively, the execution isolation system can manage booting one of the operating systems. In one embodiment, the monitoring and control functions described herein for the management domain controller can be embedded in the execution isolation system. The communication of data between OS-applications A, B can be inspected through network-based agents, using

vulnerability monitoring agent in the execution isolation system or in a separate and heterogeneous guest OS providing switching and routing of network traffic, monitoring for common embedded code signatures. Examples of common embedded code signatures include macros, Javascript, Java VM code, and binaries. In an embodiment, host computer comprises re-imaging system, which is coupled to application-OS repository, and the host computer is coupled to a shared data repository. However, vulnerability profiles, application-OS repository, and shared data repository may be implemented in the same storage unit, repository, or relational database system. Shared data repository can store data that the application-OS A, B generate in operation. Re-imaging system can retrieve copies of application-OS images A, B and transfer the images to execution isolation system. In an embodiment, application-OS repository stores a hash value, message authentication code, or other digital signature of each application-OS A, B. When re-imaging system retrieves and transfers a copy of a particular application-OS A to host computer, the re-imaging system generates a new digital signature based on the copy and determines whether new digital signature matches the stored digital signature. Thus, the re-imaging system verifies a signature of the application-OS when an image of the application-OS A is transported into memory.

Chapter 7 : CiNii Books Author - Punch, Maurice

*Abstract. The perception of organised crime as an external threat to political stability and integrity, as well as to orthodox commercial activity, is based on an assumption about the motives and intentions of organised criminals.*

Ethics How Best to Respond to Ethical Challenges in Business by Stathis Gould , Head of Professional Accountants in Business and Integrated Reporting, IFAC December 14, Most accountants in business and the public sector, whether working in a small organization or serving as the chief financial officer CFO of an international corporation, face ethical dilemmas during their professional careers. Ethical dilemmas come in many forms and accountants sometimes need support to address complex and challenging conflicts. The key findings of the CGMA survey include: Corporate leadership appears to be less actively engaged in reviewing and taking responsibility for ethical performance compared to as shown by a significant decline in the number of corporate leaders who held formal responsibility for ethics. This provides more evidence of a gap between the rhetoric from corporate leadership on ethical issues and actual practice. The majority of management accountants feel it is important to collect and analyze ethical information, but one in five do not believe their organization will do so in the near future. Business challenge 3”Ethical Dilemmas and Pressures Despite an increase in ethical codes and training, there is greater pressure within organizations to act unethically. Pressures are most apparent in emerging economies. Business challenge 4”Business Issues Security of information remains the biggest issue of concern across all markets. Bribery has risen from sixth to third in the rankings of issues of concern, reflected by the increase in anti-bribery and corruption legislation. Examples of the most common ethical dilemmas in the business environment are varied and include: Dealing with pressure to act unethically, particularly from dominant superiors; Balancing confidentiality with blowing the whistle on illegal or improper actions of others; Disclosing information in the public interest; and Wrongful trading in a distressed situation where insolvency might be imminent. Such ethical dilemmas cover various ethical issues, such as overstating performance and valuation, participating in fraudulent activity, non-disclosure and withholding of information from auditors and other stakeholders, and making a decision without adequate information. Many IFAC member organizations provide guidance, ethical resolution frameworks, and pathways to help accountants deal with ethical dilemmas. A key question for a professional accountant is whether you would be able to justify your decision to deal with a problem or conflict. A common aspect to guidance on resolving ethical dilemmas is to help accountants define and apply the fundamental principles in their professional code of ethics. The principles may potentially be threatened by a broad range of circumstances including self-interest, self-review, advocacy, familiarity, and intimidation. An awareness and understanding of these circumstances will help to establish which fundamental principles are affected by a situation and why. Stathis Gould heads up the development of international services for professional accountants working in business and industry at IFAC. A key element of his work is developing thought leadership and guidance in support of finance professionals and their roles facilitating sustainable organizational performance. Prior to serving the accountancy profession, Mr. Gould worked in various roles in the private and public sectors in the UK. Like what you see here? *Punch, Maurice. Search authors sharing the same name Coping with corruption in a borderless world: proceedings of Fifth International Anti-Corruption Conference.*

Later accounts attempt to include more detail and clarify anything that might not conform with Buddhist doctrine. This text has not been found, however. In this life, he was born as a man-eating king turned yaksha Pali: When his enemies kill him, he takes a vow just before his death that he may avenge his death, and attain Nirvana in a future life under the guidance of a master. When Bhaggava replies that he will be a lone brigand, the king decides to let it live. The story continues in the same way. Entire villages become abandoned. However, because birds begin to eat the flesh from the fingers, he starts to wear them as a sacrificial thread. Although the father prefers not to interfere, [note 6] the mother disagrees. But then when the Buddha also arrives, he chooses to kill him instead. He draws his sword, and starts running towards the Buddha. He stops first to pay a visit to the Buddha and his followers at the Jetavana monastery. The king says that he would salute him and offer to provide for him in his monastic vocation. Sister, since I was born, I do not recall that I have ever intentionally deprived a living being of life. By this truth, may you be well and may your infant be well. Sister, since I was born with noble birth, I do not recall that I have ever intentionally deprived a living being of life. Changing from a murderer to a person seen to ensure safe childbirth has been a huge transformation. With sticks and stones they attack him as he walks for alms. They wonder how it is possible for someone who killed so many people to still attain enlightenment. The Buddha responds that even after having done much evil, a person still has a possibility to change for the better and attain enlightenment.
