

Chapter 1 : Printable Counting Worksheet - Counting up to 50

Counting 1 Showing top 8 worksheets in the category - Counting 1 Some of the worksheets displayed are Counting practice from 1 to 50, Count to 50 work, Kindergarten numbers counting work practice tracing, Skip counting, Practice counting to one hundred by filling in the, Counting quarters, Write each missing o 49 50, chart.

Overview In Objective 2: Counting 1 to 30, your child learned how to skip count. In this section, your child will continue practicing skip counting to improve her speed and accuracy. In addition, puzzles will be introduced. Puzzles encourage children to discover patterns, think analytically, and devise strategies to put pieces together. Number sequencing is a fundamental concept necessary for understanding addition and subtraction. The majority of this section emphasizes number sequencing to prepare your child for basic addition, which is two sections away. Below are a series of games to teach these new concepts and reinforce counting and numeral recognition skills your child learned in previous lessons. Remember to repeat the games regularly and frequently to help your child master the material. Prerequisites If your child has difficulty completing the Intermediate Number Board, then do not start this Objective. Counting 1 to 30 for a couple of more weeks. Your child should be very comfortable counting and recognizing numerals up to 30 before attempting the following games. Occasionally, play Count, Stomp, Clap from Objective 2 to supplement the activities in this section so your child can continue practicing skip counting. If your child has trouble completing these activities, do not be concerned. Simply spend more time playing the activities that practice counting from 1 to 50. Activities MS1: Fifty Puzzle Practices number sequencing, counting, and recognizing numerals from 1 to 50. It also builds problem-solving and cognitive skills by teaching children to develop strategies to assemble each piece correctly, one at a time. Hot Potato Practices mental counting from 1 to 50 while also increasing the speed with which your child can recite numbers in a sequence. It is a great way to provide extra repetition for children in a large group setting. Advanced Lays the foundation for addition and subtraction. Understanding where a number falls on the number line helps your child understand the sequence of numbers as well as the distance between them subtraction. Intermediate Gives your child additional practice counting and recognizing numerals from 1 to 50. It also builds skills necessary for basic addition by continuing counting from various numbers on the number line.

To learn when new worksheets are added, subscribe via RSS or e-mail: Introduction to counting in order Learning to count from 1 to 10, from 1 to 20, and from 1 to are basic math skills for preschool and kindergarten children. The importance of counting worksheets Counting is the first and most basic math skill a child learns. Initially, children learn to count by ones from 1 to Next children move on to counting from 11 to Once children are comfortable counting from 1 to 20, the next big step is learning to count by 10s so that children can seamlessly count from 29 to 30 or from 39 to 40, for example. Knowing the order of the numbers and being able to say them automatically requires exposure and practice, practice, practice - which is why counting worksheets are perfect for young children. Extra tips for using the beginning counting worksheets Before you show your child the beginning counting worksheets, ask him to practice counting aloud several times from 1 to This will refresh his memory and reinforce the number sequence before he starts the counting worksheets. It is fine if your child counts from rote memorization without, for example, looking at each finger on his hands, one by one, as he counts. As your child looks at each row of numbers on the beginning counting worksheets, ask him to point to the number in each circle as he says it out loud. If your child struggles to say the correct number, consider covering up the two choices on each row and then ask your child to begin counting at the beginning of the row again. Until children understand the format of this worksheet, seeing two choices may be confusing and temporarily halt their counting. Once your child says the correct number, you can reveal the two number choices and he can trace over the dashed-line circle to select the number he just said. If the multiple rows of numbers are confusing or overwhelming for your child at first, simply fold the paper to expose just one row of numbers at a time. Help your child complete the missing number worksheets On the intermediate worksheets, your child must write the missing number in the empty box. As an added challenge, the numbers on these worksheets go from 1 to Begin by asking your child to count aloud from 1 to 20 before he starts working on a missing number worksheet. This will allow him to practice counting by rote memorization, without worrying about associating each number he says with a printed number on the worksheet page. When your child is able to comfortably count from 1 to 20, ask your child to look at the first row of numbers on the worksheet and point to each number as he counts out loud. When he comes to an empty box, direct him to first say aloud the missing number and then write that number in the empty box. If your child says the correct number but is not confident writing it, you can help him in writing the number. You could lightly write the number in the box and then ask him to trace over your writing with a darker pen. Or, you can write the number on a small piece of paper for your child, and he can use that paper as a model while he tries to write the number in the box himself. With practice, your child will become comfortable writing the numbers on his own. Helping your child practice counting to 50 and counting to Once your child is comfortable counting from 1 to 20, he is ready to tackle the more challenging task of counting from 1 to 50 or counting from 1 to With the advanced counting worksheets, encourage your child to write the numbers if he can. If he is unsure of how to write the numbers wondering, for example, if the number 15 is written with a one then a five or a five then a one , suggest that he look at the numbers on either side of the blank space for clues. When children first learn to write numbers, it is not uncommon for them to switch the position of the numerals, writing 18 as 81, for example. Your child will naturally correct this mistake as he is exposed to more two-digit numbers. What is a s chart A s chart is a visual aid that helps children understand the order of the numbers from 1 to It is an ideal way to show children a variety of math concepts because they can look at the numbers as well as directly see relationships between the numbers which number is greater than another or the order of the numbers, for example. Tips for introducing your child to a s chart The simplest way to introduce your child to a s chart is by asking him to count aloud as he points to each number on the chart. Point out that the first number on the chart is 1 and the last number is If the whole chart is a bit overwhelming at first, fold the page to reveal just a few rows at a time and ask him to begin counting. Once he begins

counting, he will quickly realize that a s chart simply lists all the numbers from 1 to , in order, and is a handy aid when counting. Activities to try at home to supplement the counting worksheets Count out loud to 20 while your child brushes his teeth. Or, say aloud the numbers from 1 to As your do, periodically skip a number and challenge your child to catch your mistake and tell you which number you missed. Write the numbers 1 through 20 on small index cards and shuffle the cards. Ask your child to place them in the correct order from left to right. Then, call out a number and challenge him to pick the card with that number out of the stack as quickly as possible. Pick a number between 1 and 20, 1 and 50 or 1 and and do not tell your child what the number is. Then, ask your child to guess the number you picked by having him say a number and then you can give a hint such as "higher" or "lower" to help guide him to the correct number. Have your child count how many steps it takes to get from one room to another or from the front door to your car. Then count how many hops or skips it takes to go the same distance. Once your child is comfortable with this game, you can encourage him to estimate the number of hops, skips, or steps it will take before he actually counts it out. Place two piles of beans, beads or pennies in front of your child and ask him which has more. Then ask him to count each pile to check his guess. When giving your child bite-sized snacks, let your child grab a handful and ask him to count each one to see how many he grabbed. Buy Our Workbook Love our worksheets? Consider buying our workbook:
