Data Management IT organizations today are constantly challenged to do more with less. Reusing data processing jobs and employing best practices in monitoring the health of your data are proven ways to improve the productivity of data professionals. You can write global functions for SAS Data Management jobs that can be reused in any expression in the system, in either data or process flow jobs. Global functions can be called from expression nodes, monitor rules, profile filters, surviving record indicators, process flow if-nodes and more. The new function is fully integrated in Data Management Studio. Handling Parameters Global functions can handle any number of parameters. Parameter helper functions are available to access input parameters inside a function: This is helpful if the incoming parameters are unknown. The first parameter is 1. The return value will either be integer, real, date, string or Boolean. You can use these functions if you know the incoming parameter type at a given position. Using the parameter function may require additional overhead to coerce the values to the field type. Using the specific data type parameter functions above will eliminate the cost of coercion. Global Function Example This global function will check if password rules are followed. Check the rules for password. There is a late binding process, which means if function B wants to call function A , then function A needs to be loaded first. The files global functions are stored in are loaded alphabetically by file name. This means the file name containing function A has to occurs alphabetically before file name containing function B. Best Practices Here are some best practice tips which will help you to be most successful writing global functions: Create one file per expression function. This allows for global functions to easily be deployed and shared. Use lots of comments. Write a global function body as an expression first and test it via preview. This way it is easier to find typos, syntax errors and to ensure that the code is doing what you would like it to do. For Studio, this could for example be found under: Good luck and please let us know what kind of jobs you are using to help your organization succeed.
