Chapter 1 : What alternatives are there to FrontPage?

Note: Citations are based on reference standards. However, formatting rules can vary widely between applications and fields of interest or study. The specific requirements or preferences of your reviewing publisher, classroom teacher, institution or organization should be applied.

Why did Microsoft abandon FrontPage? FrontPage In FrontPage and above click the Code button at the bottom left-hand of your screen. In the Page Properties window, click the Custom tab in the user variables section, click the Add button and name your meta tag. The most commonly used meta tags would be "keywords" and "description" without the quotes. See our promote your website page for additional tips and secrets in promoting your web page. How to create a table in FrontPage To create a table , click on the Table option and click Insert new table. From here you can specify the values of your table. Delete a cell within a table in FrontPage Select the cell first by going up to table and then clicking on Select Cell. Once the cell is highlighted, press the delete key on your keyboard. Note that this method deletes the cell in FrontPage 97 and in FrontPage 98 it only deletes the contents of the cells. To delete the cell in FrontPage 98 highlight the cell and right-click on the cell and choose the option for delete. How to insert a named anchor in FrontPage To insert a named anchor bookmark , click Insert from the top menu and select Bookmark. Users using FrontPage may need to click the small down arrows to see this option. Once a bookmark has been created, create a new hyperlink and point to the bookmark name with a type pound in front of the name, for example, example. Checking for grammar errors in FrontPage Users who are familiar with Microsoft Word and its ability to check for spelling and grammar errors may assume that Microsoft FrontPage does the same. Unfortunately, no version of Microsoft FrontPage could detect grammar errors. If you believe your web page may have grammar errors, you must copy and paste portions of them into a program that has a grammar checker. There are also websites, like Grammarly , that can check for grammatical errors for a small monthly fee. How to cut and paste text in FrontPage 97 Unfortunately, Microsoft has left this feature out, and the only way to bypass this is to use the keyboard shortcut keys. See our Microsoft FrontPage keyboard shortcuts page for additional keyboard shortcuts. Unable to use WebBot components or extensions Ensure that your web host provider allows you to use FrontPage extensions. Today, most web host providers no longer support FrontPage extensions because of security-related issues and because FrontPage has been discontinued. With new web standards and technology being developed since it was first released in , Microsoft felt it was best to discontinue Microsoft FrontPage. In , Microsoft announced that it would discontinue Microsoft FrontPage in December and that it would be replaced with Microsoft Expression Web.

Chapter 2 : Cleaning up your FrontPage Code

Designing Web Pages With Frontpage 97 [Ken Milburn, Jessica Burdman, Maria Mortati, Tim Forcade] on blog.quintoapp.com *FREE* shipping on qualifying offers. A step-by-step tutorial on how to make FrontPage work for designs focuses on techniques that help readers create professional-looking web pages.

Choose a website builder and make money online today What type of site do you want to build? Your home page is arguably the most important page on your website. I think we can all agree that the first impression matters a lot â€" right? You go into a shop or an office, and you are immediately greeted by a customer service representative. So the question is: How does it do that? Effective home page layout is all about making your website easy to use and navigate. People are becoming more and more demanding and impatient nowadays. Simplistically, the layout of your home page is divided into two parts: Below-The-Fold â€" content you only see when you scroll down. Statistically speaking, as you scroll down the page, the number of people who will continue to pay attention to your content will drop dramatically. Your primary content must be clear, concise and specific. You can take literally take the words right out of their mouths and use them as your headline. In this example, their users can use their product to create pages to generate more customers! We all know how to take direction because we do this every day in the real world. Does it make the business feel personable and likable? Your logo needs to do a good job of subtly communicating what your company is about. Create logical groups of related links, with the most important links organized from left to right. Keep page titles short and descriptive. Place your navigation bar in a prominent location so it is easy to find. Put yourself in the shoes of your visitors and ask yourself this: Otherwise, they would have left your site already. Nothing makes your website visitor want to find out more about you. It can also be inspirational like how great it will be to take a road trip with your family in a brand new car! The key here is to show your audience how their life will change for the better with what you are providing them. Listing out features are only helpful after you convince your visitors that you can benefit them tremendously. Focus on communicating how your visitors can truly benefit from you. Trust indicators can be customer success stories, customer testimonials or quotes, professional accreditation industry association affiliations, Better Business Bureau score , media quotes, the number of social network shares, and display personalized blurbs about your team members to create trust. People buy from people or businesses they like and trust. So by showing other people like you and your brand, you can boost your credibility and trustworthiness. So when they see others just like them do business with you, they are more likely to follow. Why do you think we constantly look up reviews on different services or products? List out your most compelling features that your visitors will want to have. While this is an important feature, it is not something most car buyers cares about. Instead, you get sold on features like infinity moonroof and speakers surround sound audio system. Volkswagen Touareg moonroof â€" Source: If you have a lot of features to list, instead of listing them all, pick the top 10 to insert into your home page. For the other features, create a separate, dedicated features page where your visitors can view the entire list of features there. Such content does have a place on your website, and if placed in the appropriate location, can help complete the overall picture what your business is about. But if they are used incorrectly, they can create clutter and confusion. You can follow these layouts to optimize your home page. You can click through to take a look at the actual templates and you can sign up and start using one right away. You can click through to see them, sign up and start using them right away. Click to enlarge image Template Examples: Choosing a template to design your website can either be a lot of fun, completely overwhelming or for most people â€" somewhere in between. We have a set of criteria we use when making template design suggestions, to help you sift through all the design options. Collect feedback from people to see how you can improve. Lastly, take a look at the template examples I shared above â€" instead of designing your own home page, those template examples can give you a head start to crafting a great looking and effective layout! Question â€" Did this guide benefit you? Leave a comment below. Do you know anyone who can benefit from this guide? Send them this page or click on the share buttons on the left. Chapter 3 : FrontPage Editor

Below is a list of the common questions someone may have when designing a website in Microsoft FrontPage. To create a table, click on the Table option and click Insert new table. From here you can specify the values of your table. To insert a named anchor (bookmark), click Insert from the top menu.

Design approach and wrapping up When designing a website layout there are some common mistakes that often pop up. In this post, we run through the steps you need to take to reach the perfect website layout. These steps cover not only design aspects but also general workflow tips that will get the job done nicely. Define what success means Get to the root of the purpose of your design Before starting the work, you need to know what it is you are designing for. Besides the description of the site, you need to know what the expectations are for it. Take a news site for example. Is it to make make as many ad impressions as possible or is it to provide the best reading experience? How are those goals going to be measured? Good redesigns are not necessarily the most flashy ones, but the ones that improve performance over time. Talking to your clients before starting your design is key to defining all of this. You need to learn what their concerns and goals beyond the written SOW statement of work are. In most cases you will have to understand the system currently in place, and if your project is meant to challenge it, find opportunities to evolve it, or follow it as it is. The options are limitless. Avoid spending too much time on a concept before sharing it with the client. Once the initial concept is approved you can relax a little bit and start production. Think about the content, the layout and the functionality before starting to drop shadows. The framework is the UI that surrounds the content and helps the user perform actions and navigate through it. It includes the navigation and components like sidebars and bottom bars. If you approach your design from this perspective, you will have a clear understanding of what your layout needs will be when designing sections beyond the homepage. Before starting to design anything you need a proper grid. To find out how to do this, take a look at this guide to creating a grid that adapts to all screen sizes. Choose your typography A rule of thumb is to use no more than two different typefaces in a website layout Exploring different typefaces and colours is part of the discovery phase of a project. Generally, I would recommend not using more than two different typefaces in a website, although it really depends on its nature. Choose a font that is easy to read for big chunks of text, and be more playful with titles and calls to action. Take a look at our roundup of perfect font pairings. Select your colour theme Tools like Color Hunt are designed to help you pick a palette During the process of choosing a set of typefaces, you should start exploring what colours you will use in the interface, backgrounds and text. I recommend a limited set of colours and tones for the general UI. Think about the layout of sites like Facebook, Twitter, Quora and Vimeo. If you get stuck, take a look at our list of the best colour tools for web designers. Simplify the layout Simple layouts tend to be easier to navigate The simpler the structure of the site, the easier it is for users to navigate. Each section needs to tell a story; it needs a reason and a final outcome for the user. The layout should help the content to highlight what are the most important pieces in that story. Refine every component Claudio Guglieri worked on the UI design at Microsoft Music Treat every component as if it could be presented to a design contest. If you pay attention to every component, the whole will be more than the sum of its parts. I have to admit that this piece of advice is not mine. I heard it at a previous agency and I was shocked by how clear and true this statement was. Each component needs to be designed as if it could stand alone as the best component ever. Sometimes designers leave certain parts of a site until last on their to-do list, and end up not showing them much respect. Walk clients through your solutions Avoid doing big reveals of your work. One of the goals of communicating often with the client is to avoid surprises when revealing your work. By doing this you will find that they either agree with your conclusions, or at some point during your walkthrough will point out a flaw or an additional variant you may have not considered. In either case you will have a conversation and the client will feel more invested as they are part of the process. Think in motion Motion is essential when designing interactive experiences Motion is essential when designing interactive experiences. No design can be judged on its own or as a static comp any more; every component is defined by its relationship with the system, and that relationship needs motion to be conveyed properly.

Motion can illustrate dynamic effects on content or interactive states within your layout. For that second purpose I recommend taking your designs a bit further into prototyping. Prototype, prototype, prototype Prototyping is the best way to test interactions Prototyping is the best way to test interactions and technology. This is yet another way you can get your client excited and on board with concepts and ideas that would otherwise need a lot of explanation. Design approach and wrapping up 1.

Chapter 4 : Essential Tips for Designing an Effective Homepage

Public Private login. e.g. test cricket, Perth (WA), "Parkes, Henry" Separate different tags with a comma. To include a comma in your tag, surround the tag with double quotes.

Contact Menu Join 62, marketing managers who get our best digital marketing insights, strategies and tips delivered straight to their inbox. Defining the purpose of the website will help you see what will attract users to the site. For example, "real estate" is not an example of a purpose. Keeping in line with the real estate example, the purpose of a realty website might be one of the following: To showcase new or featured properties for sale To help visitors find the business or realtor contact information To assist visitors in finding the right realtor for their needs Each of these purposes can lead the visitor to an action and can guide them to take further steps in acquiring property as a direct result from visiting the website. In this example, the website is a gateway to making a home sale. Another example we can use is an online portfolio site. What is the purpose of a portfolio? If the main purpose is to display your works or impress a potential employer, the homepage could showcase thumbnails of portfolio pieces in a manner that will entice the visitor into checking out more pieces. Ultimately, all of these purposes will lead to more clients or jobs, but it is important to identify your tangible goals so that you can understand how to strategize your front page layout. Differentiating goals of the homepage vs. How can this be? Trying to "make the sale" for a website right on the front page can deter a visitor. Learn the difference between a new vs. Two ways of doing this are: Get the visitor interested in the content enough to revisit Provide resources that remind the visitor to return. An RSS feed, for example. Designers can easily assume new or repeat visitors will find their way around a website if it has an intuitive user interface. User-centered designs is the concept that a design revolves around the reason why people visit the site. A design is user-centered if it can answer "yes" to the question, "If I come here to do X, can I accomplish it quickly without much thought or effort? Subscriptions and memberships Having subscription options on your homepage can encourage repeat visits. One of the most frequent subscription points on a website is via the home page. When users come to your site from a landing page other than the front page â€" the next action is usually to go to the homepage to see what other things might be of interest and to understand what the site is about. Flickr is an excellent example of a website whose front page design is effective in increasing their membership, and whose design is changes depending on whether you are logged on as a member, or not. Thus, it draws attention to a "Create Your Account" button to entice you to sign up. It is highlighted with plenty of whitespace around it. This promotes first-time users to sign up for an account. Flickr leads you to ways you can participate in the community and helps you easily perform site functions only available to people how have user accounts such as organizing your Flickr stream. Selling products or services Some websites are geared primarily to selling you their product or service. Amazon is an excellent example of how to treat new and repeat visitors effectively in order to get the most sales. A look at the logged-out version of the Amazon homepage will show the most popular products, or products that culturally popular. Amazon is able to customize their home page to cater to both new and repeat visitors. Highlight Content Effectively When choosing what content is the most important, keep in mind the following steps. Things you can consider highlighting are certain types of content "featured works or featured posts" , your RSS feed, and your contact information. The importance of these components depends on the purpose you wish to achieve. With this information in mind, you can better understand how to craft a design in a way that draws attention to the most important elements. Create a Content-Only Layout Now, with no other design elements in the way, take the list constructed in the first step, and organize the content in a manner that draws the eye in the correct order. The F-shaped pattern is often used to determine the order of content organization on a website. The top left is where the eye lands first, then to the right and down. The farther down the user gets on a page, the less they become interested and the less they read. Make Attention Happen Beyond the general layout, there are a number of other ways to bring attention to certain pieces of content. To enhance attention to crucial layout components, investigate the following possibilities: Horizon Business Coaching A recent client project brought me to consider the above options. Having multiple items to focus on can be

confusing, and one must prioritize, lay out, and highlight features as needed. On top, the brand is given importance by its location and excess whitespace. Headings are also highlighted by contrasting colors. Remember to include the necessities As we designers know, there are important site components that users expect to find in a website. Because most sites have them, spending time on their design and strategic positioning in a layout can be effective in creating a functional and memorable homepage.

Chapter 5 : Free Web Templates - Free web designs, templates and more!

Free Designing Web Pages With Cascading Style Sheets PDF 1 CREATING WEB PAGE WITH NOTEPAD USING HTML AND CSS The following exercises illustrate the process of creating and publishing Web pages with Notepad, which.

As you add text, images, tables, form fields, and other elements to your page, the FrontPage Editor displays them as they would appear in a Web browser. In this view, you can enter text, edit HTML tags, and use standard word-processing commands such as cutting, pasting, and find and replace. Although it is a powerful tool, the FrontPage Editor is easy to use because of its familiar, word-processor interface. Here are some of the key features of the FrontPage Editor: You can create new HTML pages based on page wizards and templates. The FrontPage Editor offers many choices of page formats, and you can create your own templates. You can apply one of the many FrontPage themes, created by professional designers, to give your pages a dynamic, colourful appearance. You can also add and design borders for your pages and insert navigation bars, which guide your users around your Web site. Some of the file types you can open are Microsoft Word 2. You can insert text in all HTML styles, create multilevel lists, change text size and colour, and apply formatting such as centring a heading or making text italic. Using cascading style sheet support, you can control margins, line spacing, colours, fonts faces and sizes. Using a point-and-click interface, you can create hyperlinks to pages and files in your FrontPage web or to pages and files on the World Wide Web. Point to a page and FrontPage creates the correct hyperlink syntax for you automatically. Double-click an image and it opens for editing in your favourite image-editing program. Create an image map by adding hotspots, areas in an image containing hyperlinks. Using FrontPage image-editing commands, you can crop, rotate, and resize an image, make it black and white, give it bevelled edges, and change its brightness and contrast. FrontPage includes the Microsoft Clip Gallery, a large library of clip art, stock photos, and video clips. You can create forms containing text fields, check boxes, radio buttons, drop-down lists, and push buttons. When you create a form, the default FrontPage form handler automatically saves form information to a file or sends it to an e-mail address. You can select from a set of FrontPage form handlers or add you own custom form handler to a form. Using the FrontPage table-editing commands, you can create a table, insert rows and columns, align them, and create background colours, using a point-and-click interface. You can add powerful functionality to your page by inserting FrontPage components. They add interactive features such as navigation bars, threaded discussion groups, full-text searches, and form handlers that would otherwise require complex programming. For example, the Table of Contents component automatically creates an HTML outline of your FrontPage web with hyperlinks to each page, and the Banner Ad Manager replays a sequence of images using effects similar to a rotating billboard. You can create new frames pages, edit the appearance of your frames, and assign initial pages to each frame, all using a point-and click interface. April 15,
