

**Chapter 1 : Garland-makers in Tamil, translation, English-Tamil Dictionary**

*Bring some green from the outside in with Jo-Ann's selection of garland and greenery, including hanging and potted plants to create whatever landscape you like. For the holidays or just to add a little romance and drama to your space, a Red Rose Chain garland strand is the perfect piece of green.*

**Gardening About Camia Flowers** Camia flowers *Hedychium coronarium* are also called white ginger, garland flower, butterfly lily or butterfly ginger. This frost tender perennial flower grows best outdoors in U. Department of Agriculture plant hardiness zones 8 through 11. Camia flowers are cultivated in many tropical countries to make garlands. Learning about these flowers helps a gardener grow them strong and healthy in the home garden. **Description** This tropical flowering plant reaches 6 feet tall, spreading 3 feet wide when grown in a container. Large green lance-shaped leaves grow up to 24 inches long and 5 inches wide. Each white blossom resembles an orchid-like butterfly and releases a strong sweet aroma in the evening. The blossoms cluster together in an arching spike, 4 to 8 inches long, appearing from summer through fall. **Growing Conditions** Camia flowers are native to India, in a region that stretches from Himalaya to Java. The stems grow up to 20 feet tall in its native habitat. This plant prefers wet soil and grows naturally in wet areas along streams and forest borders. Camia flowers grow well in full sun to light shade exposures around water gardens or ponds, where the crown is sunk into shallow water. **Care** The best location for camia flowers in the ground contains a lot of organic material. When growing in a container, mix together one part potting soil, two parts peat moss and two parts sand. Keep the soil watered and do not let it dry out. Feed with diluted liquid flower fertilizer each week during the blooming season. Cut away the old stems once they flower in order to promote new growth. **Propagation** Camia flowers are vigorous growers and need dividing each year. Late winter or early spring is the best time to use division to propagate this plant. Camia flowers germinate well from seeds when sown in a greenhouse. Once the sprouts are large enough, transplant them into individual plant pots. Do not plant outside until late spring or summer.

*Botanical name - Hedychium spicatum Family name -Zingiberaceae English name -Spiked Ginger Lily, Garland flower  
Common name - Spiked Ginger Lily, Kapurkachri Synonyms - Palashi, Sadgrantha, Gandhamoolika, Gandharika,  
Vadhu, Gandhapalashi.*

Spring Flower Garland Happy Monday! Did you guys have a good weekend? Erin and Sarah are the brains and brawn behind Rosehip Flora , a floral design company in Austin, Texas, which specializes in weddings and events. Erin is kicking things off with a feminine, whimsical how-to of a spring flower garland that would be SO lovely draped around a front door or even down the length of a dining table for an early spring brunch or dinner party. Keep reading for the full how-to! Our first post is a happy, springtime garland how-to. It only takes the right tools and materials and a little bit of patience. Its dried vines are strong and sturdy, making a perfect piece to attach all our components to. I also like the way the dried vine represents the bare bones of winter. Gathering all the necessary materials is important to keep the project flowing. In this project I used the aforementioned vine, floral foam garland, floral wire, wire cutters, flowers cleaned and prepped, snips and scissors. I soaked a garland of this in a bucket of water spiked with a floral preservative. These pieces were then attached to the vine at randomly chosen points for a natural end result. First I cut camellia foliage down and began inserting into the wet foam. This allows the stems to enter the foam easily. Keep the initial foliage and floral cut short to hide the foam, which allows for a nice full look. I used a bright mix of golden yarrow, blush spray roses, pink matsumoto asters, peach carnations, seeded eucalyptus, and my personal favorite yellow acacia. In this case, I used pink quince and longer pieces of camellia. Purple lisianthus was used more sparingly to pop out of the arranged pods. Vibrant, fun floral, adding life to the withered vine of winter.

## Chapter 4 : Purple Spiked Flowers

*One of its species, white ginger lily (Hedychium coronarium) is the national flower of Cuba, where it is known as "Flor de Mariposa". A farmer's house is not complete without a white ginger in the garden.*

Add to Bookmarks Here, we will look at two beautiful bloomers, Mountain Garland *Clarkia elegans* and Rocket Larkspur *Consolida ambigua*, with lovely clusters of blooms. Two plants which are perfect for the neglectful gardener. Some plants are perfect choices for forgotten areas in the landscape. Is there a spot in your landscape that could use some color, perhaps an area that does not receive as much attention as your other gardens? Planting these two annuals might very well fill that spot without the work it typically takes to plant other annual flower beds. Mountain garland *Clarkia elegans*, syn. The pastel clusters of blooms on spikes reaching to three feet are often mistaken for rocket larkspur *Consolida ambigua*; however, the bloom spikes of mountain garland are purple-black while the larkspur has green spikes. Although naturalized in the United States, rocket larkspur is native to southern Europe. What makes these two plants perfect for the forgotten areas in the landscape is their ability to survive and thrive without any real fuss. Growing conditions for the two are as near to identical as you can get and the color combinations are such that every gardener should be able to find varieties for their favored color palette. Basic tips for growing mountain garland and rocket larkspur are given below. When to Plant Start seeds indoors approximately three weeks before last frost. Set out as soon as possible after last frost to prevent scraggly growth. At my place zone 8b, the seeds can be scattered in the fall and will sprout in early spring. Soil Any well-drained garden soil including gravelly, sandy soil will do. They will not do well in heavy clay soil. Plants may grow in clay; without efforts to amend the soil, the blooms will be sparse and fallen seed may not germinate the following spring. Water Water regularly but do not overwater. Base of plants will rot if left to grow in wet areas. Light The plants grow best in full sun but will take partial shade though may not bloom as prolifically as if given full sun conditions. Feeding Feed with a general purpose fertilizer in spring, compost tea is great, but only at about half the rate of other bedding plants. Too much nitrogen will cause plants to grow leggy with dark foliage and fewer blooms.

**Chapter 5 : A Sea of Pastel: Mountain Garland & Rocket Larkspur - Dave's Garden**

*Photo about Gorse flowers forming a circular garland, creating a border, over white background. Image of spiked, thorn, spring -*

Not the plant I ordered! But glad I decided to keep them once they came up. Striking, robust, brilliant-colored plants. So graceful and delicate looking, but can withstand the elements like a champ. Had some deer mow them down to just 3 inch stumps and they came back beautifully after I moved them to deer-free territory. Thank you nursery, whichever one you were, who sent me these instead of echinacea green eyes. They were part of a shade garden seed package I bought and were sown directly in the garden. The plants are a bit spindly, probably because of growing in shade, but have produced lots of very nice flowers. I started this from a Ferry Morse Butterfly and Hummingbird Wildflower Mix, which considering the various sowing depths preferred, what was actually going to come up was a question. The Mountain Garland was profuse in the first year, with the Shirley Poppies. Now in the second year, very little of the original seed plantings are coming back, but a few of the Clarkia are making an appearance in May. I love this plant! Unlike some of the others who have commented, this plant has never survived summers for me. I just seeded them in about a month ago and some of the little plants still seedling-sized! I can only think of a handful of annuals that are easier to satisfy. I started these rather late from seed in a window box. They did reach the point that 1 or 2 had small blooms. Maybe, based on the comments by bemidjigreen, I left them too long in the cells? Clarkia It is a perfect choice for a cottage garden. They look stunning with feverfew var white wonder. It does not self-sow so you will have to start from seed each year. It is a very easy annual to start from seed. Its best to start about 4 weeks before planting out time in your area. If planted when only " tall, they will be upright in the garden. If you let them sit in seedling packs longer they will ramble rather than reach their full height. In my area that is about 18". It blooms for a long time from seed that I usually plant fairly early in the season March, mostly. It does reseed, but not heavily. This plant is also listed in some seed books as Mountain Garland. This will be my first year for this plant and looking forward to adding it to my garden. I winter sowed it the first week of Feb and I think every seed germinated. Beautiful, nontoxic, easy to grow in a warm climate!!! I live in Central Texas, on the border of Zones 7 and 8. I got it for. It was on clearance; slightly wilted. I figured, what the heck I bought it for my 4 year old niece 2 years ago who wanted it for its elegant, delicately shaped purple flowers that sort of resemble small orchids. Flower color is a very intense purple. It perked up in minutes. I agreed to grow it for my niece when she visits. When she visits she makes bouquets, crowns, and necklace-garlands out of the many flower spikes hence the name. It went into unamended clay in a sunny and poorly drained part of my Iris bed in June. I neither fertilized nor mulched. Hungry sowbugs, gluttonous locusts grasshopper plague, even vicious fire ants leave it be!! All I did was remove grass from it once a month, leaving a 1" grassless zone around it. It amazingly survives Summer temps up to F even without mulch.. It looks sort of like Larkspur spikes, except this plant is nontoxic. Except for snoozing thru Summer scorch can you blame it?? Supposedly, this plant is an annual. But I mulched it under 2" of straw just in case. To our delight, it sprang up early this Feb. Overall, this plant is Highly Recommended!!! I first grew clarkia because I had good experiences with godetia in our climate, and they are related. The clarkia were late to bloom, but put on quite a show. I planted a mix of doubles, and they bloomed in white, rose, salmon, lavender, and pink. The blooms appeared along the woody stems, as did the seed pods, shaped like little cucumbers. Garland flower comes in a rainbow of colors including red, rose, orange, purple and white. Flower spikes 2 feet or larger open from the bottom upward. Native to North America it also makes an excellent cut flower.

**Chapter 6 : In Bloom: Spring Flower Garland |**

*Common names include garland flower, ginger lily, and kahili ginger. Members of the genus Hedychium are rhizomatous perennials, commonly growing cm ( in) tall. Some species are cultivated for their exotic foliage and fragrant spikes of flowers in shades of white, yellow and orange. [4].*

**Chapter 7 : Kapur Kachari is used in the treatment of respiratory disorders**

*In Bloom: Spring Flower Garland. Happy Monday! Did you guys have a good weekend? We still have snow on the ground and a little expected in this week's forecast, but all the cheery color popping up during New York and London fashion weeks is making me so ready for spring.*
