Follow this link to find that all important nearest Caltex: Find a flat, stable and safe place to change your tire. You need a solid, level surface that will restrict the car from rolling. If you are near a road, park as far from traffic as possible and turn on your emergency flashers hazard lights. Avoid soft ground and hills. Apply the parking brake and put car into "Park" position. If you have a standard transmission, put your vehicle in first or reverse. Place a heavy object e. Take out the spare tire and the jack. Place the jack under the frame near the tire that you are going to change. Many cars have molded plastic along the bottom. For most modern uni-body cars, there is a small notch or mark just behind the front wheel wells, or in front of the rear wheel wells where the jack is intended to be placed. Raise the jack until it is supporting but not lifting the car. The jack should be firmly in place against the underside of the vehicle. Check to make sure that the jack is perpendicular to the ground 6. Remove the hub cap and loosen the nuts by turning counterclockwise. Use the wrench that came with your car or a standard cross wrench. Your wrench may have different sizes of openings on different ends. A correctly-sized wrench will slip easily over the nut, but will not rattle. It can take quite a lot of force to break your lug nuts free. If all else fails, you can use your body weight or stomp on the wrench be absolutely certain you are turning it the right way - counter clockwise. A cross wrench will give you much more torque than a standard single-handled wrench. Pump or crank the jack to lift the tire off the ground. You need to lift it high enough to remove the flat tire and replace it with a spare. As you lift, make sure that the car is stable. If you notice any instability, lower the jack and fix the problem before fully lifting the car. If you notice the jack lifting at an angle or leaning, lower and reposition it so that it can lift straight up. Remove the nuts the rest of the way. Turn them counter clockwise until they are loose. Repeat with all lug nuts, then remove the nuts completely. Place the flat tire under the vehicle so in the event of a jack failure the vehicle will fall on the old wheel, hopefully preventing injury. Place the spare tire on the hub. Take care to align the rim of the spare tire with the wheel bolts, then put on the lug nuts Tighten the nuts by hand until they are all snug. They should turn easily at first. Using the wrench, tighten the nuts as much as possible. Going in a star pattern around the tire, one nut across from another, give each nut a full turn until they are equally tight. Avoid using so much force that you risk upsetting the jack. You will tighten the lug nuts again once the car is down and there is no risk of it falling. Lower the car without applying full weight on the tire. Tighten the nuts as much as possible. Lower the car to the ground fully and remove the jack. Finish tightening the nuts and replace the hubcap. Put the old tire in your trunk and take it to a mechanic.
