

**Chapter 1 : Los Angeles Times - We are currently unavailable in your region**

*Michael Gets the Measles has 2 ratings and 1 review. Tammy said: For those of you who want to live in the stone age and not inoculate your children, this.*

We are being fed information that is essentially inaccurate by media journalists – none of whom have medical degrees – which may actually be promoting medical harm to our children. The latest reports blaming a failure of the measles vaccine on the unvaccinated population are not accurate, and in some reports, not true at all. In fact, over the past 30 years, there have been similar numbers of measles cases reported in various areas of the United States. Studies published in leading medical journals, such as the New England Journal of Medicine, American Journal of Epidemiology, American Journal of Public Health and others around the world have confirmed small numbers, cases of measles annually. So why then is the latest statistic of over 90 cases of measles spread over 14 states, representing tens of millions of people being billed as an epidemic? The media would have us believe that this is a result of the fringe population of anti-vaxers who refuse to have their children vaccinated according the guidelines of the current vaccine schedule. Medical reporting has brought to light the glaring ineffectiveness of the measles vaccines in fulfilling their widely claimed promise of preventing outbreaks in highly vaccine compliant populations. Last year 1 in every , Americans came down with the measles. Nearly all recovered in a few days without serious consequences. At the same time 1 in 68 American children were diagnosed with autism or for every case of measles there were cases of autism. I ask myself which is the real epidemic here? I wish these journalists, vaccinologists and infectious disease specialists spent a week in my office. I wish they would actually listen to the testimonials given to me by parents of autistic children who were obviously affected by these vaccines adversely. I wish they would tell parents that the risk of dying from the measles in the United States is around zero. I wish they would admit that they are being told by pharmaceutical companies not to report certain statistics or to cover up factual scientific information. I wish they could be free to report honestly about vaccines rather than being dependent upon drug advertising and internet information. This is an emotional debate for sure. If we discount emotion and fear, we would realize that a child may have a greater chance of getting struck by lightning, accidental drowning or possibly from adverse side effects of the MMR vaccination itself than from acquiring live measles infection. I am not advocating that vaccines be discontinued. I am advocating that doctors and patients become aware of the ingredients of these vaccines, what they can potentially do to affect an adverse outcome in an immunologically compromised child. Adverse reactions to MMR and other vaccines have been reported in numerous clinical trials and studies. I am advocating that medical practitioners and researchers, not journalists, address the real medical epidemics of autism, asthma, GI disease and autoimmune diseases facing our society and people around the world. Stop hyping the safety of MMR vaccines which may actually be more dangerous than live measles and may be ineffective in preventing the illness which they are so anxious to report as a dangerous epidemic itself. **Chapter 2 : TBT (Throw Back Thursday) Measles BEFORE The Public Brainwashing | The Liberty Beacon**

*"Michael Gets the Measles" is a page illustrated story designed to acquaint students with the symptoms of measles. The book seems appropriate for students in kindergarten through grade 2. The story traces the development of Michael's symptoms, from his fever, to his spots, to his return to good health.*

Spotting Measles October 4, Measles is a contagious childhood disease. An infected person is contagious several days before the rash appears and remains so until the rash is gone. The rash, which shows up about four days after the onset of cold-like symptoms, usually starts on the face, and spreads to the entire body. It starts to fade within several days. Measles is rarely serious, but in a small number of cases can lead to brain damage or death. Data on measles in the U. There are now 21 confirmed cases of measles in Orange County, the most of any county in California and nearly five times the number of cases in the entire state at this time last year, health officials said. Across the state, the numbers also moved forward, climbing to 49 cases by Friday. Last year, at this time, there were only four reported in the entire state. There are now 21 confirmed cases of measles in Orange County, the most of any county in California, health officials said. The number jumped upward from seven cases less than two weeks ago. Measles cases are up across the state and rose to 32 cases by March 14, far higher than the three reported cases from the previous year. The bulletin, which advised "Hoosiers and out-of-town guests" to "Practice Good Health Defense for a Safe Super Bowl Sunday," offered tips about healthful eating, drinking in moderation, keeping warm and storing party foods properly to avoid food-borne illnesses. Less than a week later, the department circulated another release that touched on a Super Bowl health hazard few had considered: State health officials reported two confirmed and two probable cases of the respiratory ailment. One of infected individuals had attended pre-Super Bowl celebrations in downtown Indianapolis on Feb. In a weekend broadcast, he said 11, children have contracted measles during the first three months of , compared to 1, during all of The outbreak accounted for more than half of the 66 measles cases in the United States in Widespread use of the measles vaccine has dramatically reduced the incidence of the disease over the last four decades. Officials have not identified any other people exposed to measles by those cases, the statement said. March 21, By Matthew Fleischer, guest blogger To vaccinate or not to vaccinate. But for some reason it is in America. Deadly diseases such as measles and polio are no longer a threat to the majority of vaccinated Americans. Measles is spreading in upper Manhattan and the Bronx, according to public health authorities in New York. Much of the current outbreak is traceable to the Philippines, where the disease is raging and easily spread to unvaccinated travelers. They come home to the U. Health experts add these to the tally of the anti-vaccination movement, which is based almost entirely on a long since debunked and withdrawn paper published in Britain in Though only about a dozen cases have been reported so far, many more people have been exposed to the virus. One had traveled to Asia; the other had been exposed to a recently infected traveler. Perils of the unvaccinated February 25, Re "As flu passes, new threat rises," Feb. Equally significant, those vaccine objectors who "go bare" and then fall victim to infection may expose many others to cross-infection. Available vaccines, while proved safe and effective for many of those who are at risk, are admittedly not perfect. This post has been updated as explained below. In yet another sign of the perils and irresponsibility of the anti-vaccination movement, thousands of riders of the Bay Area Rapid Transit system are being warned that they may have been exposed to measles -- a disease that was declared eliminated in the U. The latest threat comes from an unnamed and unvaccinated UC Berkeley student who apparently contracted The student, who was not identified, took a Bay Area Rapid Transit train from his home in Contra Costa County to the college campus to attend class, officials said. So far this year, seven Los Angeles County residents have died and 2, cases of measles have been reported, compared to 1, cases in all of
