Chapter 1 : Old/Used Microsoft BackOffice for Sale

Microsoft BackOffice Small Business Server Resource Kit combines a collection of utilities on CD-ROM with a volume of documentation. Collectively, the software and explanatory material are meant for systems integrators involved in putting together customized solutions based on BackOffice Small Business Server

Reusable configuration file and deployment tool Appropriate components upgraded New components installed in the correct sequence Appropriate service packs applied in the correct sequence One of the primary difficulties in business computing is deploying server platforms. A number of factors can complicate a server rollout: Administrators may not know what applications or services to install based on their needs such as a publishing platform vs. Administrators have to go through many screens and steps to install the various components and often have to enter the same information multiple times, increasing setup time. Setup options and required information can be confusing and unfamiliar. Administrators may not know what is already installed on their system. Dependencies between applications can cause upgrade problems – what can be upgraded vs. Businesses need a simple and integrated method to install and configure services in a way that closely matches their needs. Windows NT Server 4. It is designed principally to support one-way publication from the organization to individual users, rather than two-way communication. It is designed for small networks containing only a few servers. It is designed to provide complete flexibility in how BackOffice Server is installed. Specialized Start Page, help, wizards and post-configuration task lists Graphical deployment tool for configuring scripts for mass rollout of similar server configurations Lab: BackOffice Setup automatically detects what may already be installed on the server in order to recommend the best possible upgrade. This saves the administrator having to manually determine what server software versions already exist, and what needs to be done to load the most current versions, including which components should be upgraded, what service packs will be required, and in what sequence they must be applied. Installing BackOffice Server 4. This installation will provide you with all of the application services necessary for publishing, collaboration and line-of-business solutions. This option is fully customizable. Note that this is only one setup option. Customers are not required to install all applications at once and can select only those they need. Use the following as a checklist: Create an unattended setup script Replicating the configuration across multiple server deployments Review the Branch Office setup scenario Deploying BackOffice Server to branch office locations with a custom scenario Step through Setup Wizard Greatly reduced number of setup screens, gathering all information up front for unattended installation Use the BackOffice Deployment Wizard to modify the setup script Rolling out two more BackOffice Server-based systems in your organization with the same configuration Use the BackOffice Start Page Get up and running quickly after installation From your Windows NT Server 4. The BackOffice Server 4. Figure 1A BackOffice Server 4. In the License Agreement dialog, read the agreement, and click the "I Agree" radio button. Click Next to continue, and the Identification dialog box appears. Enter your name, organization – these should be filled in by default – and the CD-Key number from the back of your CD case in the Product ID entry line. In the Autologon Password dialog box, enter your Administrator password if any, and check that the "I will log on manually after reboots" option is cleared – this will allow BackOffice Setup to automatically log itself back on to continue installation after mandatory reboots this option automatically disables itself upon completion. If your browser does not support inline frames, click here to view on a separate page. BackOffice Setup will analyze your system to be able to recommend an installation depending on what is already installed, which should only be Windows NT Server at this point. Note Before Setup begins installing these components, you will be able to customize the installation to meet your unique requirements. You can choose to add or remove components from the installation or to change default settings such as folder locations. At this point, you need to choose which solution you will install. Select Complete, and click Next – this will install the publishing and collaboration services you need, as well as all of the sample applications, Web-based and MMC administration. This brings

you to the BackOffice Components for Complete Solution dialog box, with questions about mainframe access and systems management. The Your BackOffice Complete Installation dialog box appears, allowing you to confirm your choices for application installation, and "if desired" change the destination directories. The defaults here are fine you can browse through them by clicking Customize My Solution. Figure 1D Confirming options to install Now you must assign the service accounts for the BackOffice applications to use. Repeat this procedure for each listed application or service. When finished, click Next. In the Exchange Server 5. Figure 1E Exchange Server 5. In the Site Server 3. Figure 1F Site Server 3. The Local Address Table is a list of IP addresses and ranges that constitute your private network "IP addresses external to your network are specifically excluded. Proxy Server will screen data according to the addresses you specify" defaults are filled in for you, but you can change these by adding to, deleting from or resetting the table. Click on Add, Delete or Reset accordingly. Click Next to accept the defaults and continue. Figure 1G Proxy Server 2. The Systems Management Server 2. Figure 1H Systems Management Server 2. Using the tree view in the Your BackOffice Installation dialog box, you can confirm settings and make any last-minute changes use the Back button to go back and change settings. Note If you started with a "naked" Windows NT 4. You can click Cancel at any time to halt the process. The BackOffice Server installer will now copy all the files to your hard drive in the locations you specified and configure the applications. By observing the status given in the BackOffice Server Component Installation dialog box, you can see how the process is going. After the installation of Internet Explorer 5. Setup will log on automatically and continue the software installation. After primary installation of the component software has completed, the Microsoft Exchange Performance Optimizer will launch. It is not necessary to run the optimizer, as this is not a production server this tool configures Exchange Server for the best possible performance on your system. Click Cancel to close the tool. If any errors occurred during setup, the Your BackOffice Installation dialog box appears with a status summary. When you have finished reviewing it, click Next. Remove the final CD. Deploying BackOffice Server to Branch Offices Branch Office Deployment Benefits Recommended Configuration for Branch Office Customizable for deployment into remote locations Can be replicated for deploying multiple servers to maintain consistent infrastructure Easy to Deploy Reduced installation time when run unattended Edit and Reuse capabilities for multiple servers with slight configuration changes Graphical deployment tool for editing scripts Easy to Manage Branch Office Manager MMC console allows remote management of servers where there is no on-site administrator. The Branch Office scenario allows the server installation to be customized for deployment into remote locations where there is little or no administrative expertise, low-speed network connections, yet users who need connectivity to corporate applications, data and services. Key BackOffice Branch Office scenario attributes include these: A system administrator would run BackOffice Setup using the Branch Office scenario on a system with hardware configured the same way as servers deployed to remote locations. Selections can then be made to reflect the desired software configuration and further modified in script files used on each new system. A system administrator would use this method to create an installation script file that would be reused across multiple servers needing the same software configuration. Using the Branch Office Scenario Exercise 1: Open a Run dialog box from the Start menu, and enter the following: It can then be used to replicate the configuration on other BackOffice Servers, such as to branch office locations. Follow steps 2 through 8 in the previous exercise, in order to go through the initial setup dialog boxes. The next dialog box you will see is the scenario-based installation wizard BackOffice

Business Solutions. Select Branch Office and click Next “ this will configure the setup script for publishing and collaboration services, and Web-based and MMC administration, but with settings specific to a branch office deployment. In the BackOffice Components for Branch Office Server dialog box, answer the questions about which components to install as you see fit since you will not actually be installing the software in this exercise; you can otherwise follow the steps here. Remember what settings you choose, so you can refer to them in the script file. In the BackOffice Server Programs and Their Components dialog box, experimentally change a couple of the drive locations if you have more than one disk on your server. Do this by selecting a component in the scroll-down list, and either click Change Folder to alter its install location, or change the Drive letter option at the bottom. Figure 1B Changing installation directories In the Folders for BackOffice Server Data dialog box, you could select various data components and change their installation location. Change one of them, and click Next. Figure 1C Changing folder locations for server data In the Administrator and Services Accounts for BackOffice Server Programs dialog box, assign the administrator account to all services as you did in the previous exercise. In the SQL Server 7. Change a couple of options, and click Next. You would want to configure SQL Server to be able to communicate between this branch location and the home office. This sets up Exchange to replicate the directory between the two servers in this one organization, so that branch office users have local mailboxes with full corporate access. Accept the defaults in the NT Option Pack 4. Accept the defaults in the Proxy Server 2. Do the same for the Local Address Table Settings. You would normally configure these according to how your network is set up. Accept the defaults in the SNA 4. In the Systems Management Server 2.

This is one of the most frequently occurring queries that I have come across while browsing through different forums and communities. Some users experience corruption of their Outlook OST files more than once and in worst-case scenario, repeatedly. There can be many reasons for this, depending upon the scenarios in which the corruption occurs. In this blog, we have tried to put together all the different scenarios, which lead to repetitive corruption of OST files. There may be a different reason for every different scenario. In general, these are the major reasons behind OST corruption. It takes up to 5 minutes in total for emails to be synced with Exchange server at an internet speed of However, in case due to any fault in the synchronization process, the mails may not be successfully synced to the server. The persistent failure in synchronization process ultimately leads to OST file corruption. The synchronization issues might be a result of network issues. Check your internet connectivity. A poor net connection may lead to repetitive halt in synchronization process and ultimately leading to insistent OST file corruption. Viruses may enter in your system from unsecured websites, infected pen drives, spam emails and so on. These viruses corrupt the internal structure of OST files and render them in an inaccessible or corrupted state. These OST files when opened with Outlook generate errors and the data items residing within the file refuse to be accessed. Get anti-virus software installed in your system. If you already have one, upgrade it to the latest version. This will protect your system from harmful virus infection and will no longer corrupt the OST files. In case the drive in which the OST file is located, is posing some corruption issues, then there are chances that these will end up in corrupting the entire data residing on it, including your OST files. Change the default location of your OST file and save it on a different drive. Also, take a backup of your OST file in an external device and get your hard drive checked for any damage. This may prevent continuous corruption of your OST file. Conclusion The above-mentioned solutions may help to put a stop on the time and again corruption of the OST files. However, in case the above solutions, do not work out for you and you still are not able to recover the data residing in the OST file, then you can download a third party tool. This PST file can later on be imported in Outlook and the data residing within it can be accessed easily.
