Chapter 2 : Dieter Stoye, Werner Freitag (Editors) Paints, Coatings and Solvents ppt

The first edition has been completely revised, the second edition thus is an up-to-date overview of the industrial aspects of paints, coatings, and solvents including composition, production, processing, uses, and methods of analysis.

Readers are advised to keep in mind that statements. First Edition IW3 Second. British Library Cataloguing-in-Publication Data: IYYX Printed on acid-free and chlorine-free paper. All rights reserved including those of translation into other languages. No part of this book may be reproduced in any form - by photoprinting, microfilm, or any other means - nor transmitted or translated into a machine language without written permission from the publishers. Composition, Printing and Bookbinding: D Wurzburg Printed in the Federal Republic of Germany Preface to the Second Edition The work at hand offers a wealth of information about coating materials and coating processes in a form that is clearly laid out. The swift pace of developments in the past few years has made a revised edition seem appropriate. The organization and structure of the work have been maintained, but changes and additions to content have been made where necessary. In particular, attention has been paid to updating economic data and information on standards, laws, and regulations. Commercially available products and their producers have also been subject to clearly recognizable changes, and these changes have been in part caused by the growing tendency of companies to merge and concentrate on their core businesses. Among products and processes, the trend to environmentally friendly alternatives has also increased, even though the share of solvent-containing coating materials still dominates the market. Therefore, the article on solvents will remain indispensable for some time to come. The second edition will serve to confirm the book in its role as a standard reference for anyone working with coatings. At the same time, they serve to decorate and color buildings, industrial plants, and utensils. Coatings are of high economic importance because they provide protection against corrosive and atmospheric attack. It is therefore understandable that in industrialized countries such as the European Community, the United States, and Japan the annual consumption per capita is high and is continuing to rise. There are numerous paint systems, production and process technologies due to the many demands made on quality, processibility, and economical importance. Comprehensive information on all paint systems and binders, pigments, fillers, and additives has been given in individual chapters. Modern, low-emission paints such as high-solids paints, water-borne paints, powder paints, and radiation-curing systems are also discussed in detail. There are special sections which deal with different production and processing technologies. Recommendations for each target application of a coating system are provided. Finally, special treatment of state-of-the-art paint testing, analysis, environmental protection, recycling, and toxicology is offered. Although the paint industry has made great efforts to substitute volatile and organic solvents for environmental reasons, the majority of paints today still contain these solvents since they are useful processing agents. A knowledge of their physical data, their toxicological and environmental properties as well as the interaction between solvent and binder forms the basis for practice-oriented paint development. The inclusion of the chapter on Solvents is an ideal addition to this presentation of coating systems. The special value of this book is that it provides a concise, up-to-date overview of all the properties of paints and coatings, their production and processing technologies, and applications for a wide readership. The publisher has successfully gathered together authors of international renown. Undoubtedly, the book will become a standard work for all producers of raw materials, paints and coatings, for users of paints and coatings, as well as for institutes and public authorities.
