

## Chapter 1 : Obtaining farmers'™ perspectives on water quality makes sense

*Water today is cheap, poorly managed and becoming increasingly scarce, and what is already a complex issue is only going to get more complicated as the global population continues to swell and the world's aging infrastructure gets older.*

Similar to the challenges facing us with climate change, action on water scarcity is torturously slow. But unlike climate change, water shortages are a near-term life-or-death situation. On Tuesday, Dow Chemical Co. Sixty representatives from industry, academia, nonprofits and other thought leaders each offered back-to-back one-minute messages about water as it relates to people and businesses. Is Dow the right company to talk about the future of water? The company has had its own water-related issues, including a dioxin clean-up near its headquarters and lawsuits alleging water contamination. It has also managed to reduce water consumption at its biggest production site by a billion gallons a year, which is fairly impressive by any measure. In any case, the virtual conference included a wealth of interesting information. Below are some memorable quotes that caught my attention from the program, which is still available online: Companies that have invested in water technologies include Khosla, Kleiner, DMJ -- huge corporations out there. I think all of this activity bodes well for the future of water and our ability to handle our water challenges, though there is a long way to go. Similarly, from India to the Gulf countries, per capita water use is two to three times that of the cities which have more efficient water use. What we are seeing though is a massive change in the way people are engaging with their resources and their governments because of new technologies. They found that if they add some fermented urine to them that the mushrooms will grow much faster. This leads to big anomalies in the water sector. For example, water is the biggest user of energy. What we need to do is step back and look at the opportunities created by these anomalies. Half of all hospital beds around the world are filled with people with waterborne diseases. You can also use water-saving devices, include high-efficiency toilets, shower heads, aerators, washing machines and dishwashers. You can find even greater water savings outdoors. Again, fix all leaks. Use soaker hoses and drip irrigation. The Nature Conservancy recently did a poll of 1, Americans and less than a quarter could name the actual lake or river where their water comes from. Water availability and purity are increasingly scarce, not only in arid regions. The removal of inefficient subsidies, technological innovation and better water management must each do their part to solve the global water crisis. But so must each one of us. We must do nothing less than re-examine our relationship with water.

## Chapter 2 : Perspectives on Water and Climate Change Adaptation – blog.quintoapp.com

*Professional Perspectives on Water Fluoridation - Available on DVD In a full length video produced by the Fluoride Action Network, respected professional researchers, scientists, and health.*

## Chapter 3 : inDepth Water Perspectives | indepthwateryearbook

*Lydia Powell is an employee of the Observer Research Foundation, Center for Resources Management, and the editor of the ORF Energy News blog.quintoapp.com Mittra is a researcher with interest in policy research associated with water development and sustainability.*

## Chapter 4 : Perspectives – Page 45 – Blue Water Healthy Living

*A global perspective on water management predominates in high-level policy discussions. This has the advantage that over-arching issues can be highlighted and international resources mobilized.*

## Chapter 5 : 10 Perspectives on the Future of Water | GreenBiz

*Learn more at blog.quintoapp.com 2 Introduction Our second annual, comprehensive national study of American*

*Consumers and Experts from across water, environmental and.*

**Chapter 6 : Fluoride Action Network | Professional Perspectives on Water Fluoridation**

*Water is an important natural resource which forms the core of the ecological system. Human use of water depends on ambient water quality and human alterations of the landuse have an extensive influence on water quality. Water is typically referred to as polluted when its quality is adversely.*

**Chapter 7 : C-Suite Perspectives on the Value of Water “ Infrastructure Week**

*Update on water fluoridation, released January This may very well be the best 28 minutes you spend to understand the true dangers and truth about water fluoridation.*
