Chapter 1 : Placement Management System - Free Final Year Project's

Placement management system is a student/company information system which is a window based application created in Core blog.quintoapp.com project has been developed on the basis of "Placement Cell" being presently used in the University for storing and retrieving the information of students and companies who are registered in placement cell.

Project Objective This Placement Automation System project aims to build a Placement Automation System that will facilitate the interaction between college students, the placement cell of the college and the recruiting companies. The system will maintain student information such as grades, courses taken, endorsements from faculty, etc. All this student information will be uploaded by the student and will be made public after verification by the placement cell. This will ensure that companies that visit for recruitment can review student credentials even before they reach the campus and they can also share these credentials with upper management remotely. The system will be updated by job postings by the companies. Companies will be able to share information regarding the job, payment and selection procedure. A schedule for the recruiting drive will also be posted. Students who meet the criteria will be able to apply and will then be notified at each stage of the recruitment. Further information about the company can be gathered by students. Students will be given the opportunity to go through the company websites, employer review sites such as glassdoor. Students who create such a profile will be mentioned as the contributor and the company will also be notified about which students took a keen interest in knowing about the company. This will enable all the students in the recruitment drive to be well read about the company before attending the interview. The Placement Automation System will also enable the placement cell to easily spot trends and note statistics. For example the system will enable the placement cell to find which type of company attracts the most students and how many students prefer greater growth opportunities vs. Existing system The existing Placement Automation System is for the placement cell to send out mass e â€" mails or through the presence of posters at a central location. This Placement Automation System requires that a student constantly peruses their e â€" mail of the posters to remain informed about the placement process. Every company that appears for recruitment will demand student credentials and the lack of a computerised system for the same means that students will have to make many copies for each company they interview for. In the existing systems surveys will be taken separately to gauge the interest and the other trends in placements. Statistics will be calculated after placements by compilation of all the different documents used for the placement. Proposed system In the proposed Placement Automation System students need not worry about innumerable copies of each certificate, instead the system will enable a greener and less paper intensive approach to placements. Companies will be able to access student credentials on line and these can be shared to managers located elsewhere before a final decision is taken. The possibility for student research into the company will give students an avenue to impress the company even before the interview and it will help many more students to understand the company they are interviewing for. The automated system will be able to produce graphs on trend and statistics on demand for use by the placement cell. More Projects for You: The admin module of Placement Automation System will be used by the placement cell. Through this module login IDs can be created for students and the recruiting companies. Statistics and trends can be viewed through this module as well. The admin will be able to approve job postings by the companies, student researched information of a company and student credentials post verification. The student will be able to browse company job profiles, submit reviews and apply to profiles they like. This module will send automated messages to a student about the profiles they have applied to and automatic notifications will ensure no deadlines are missed. The recruiting company can use this to post job profiles, browse student credentials, short-list students based on credentials and accept students for the recruitment process. They will post updates about the process through this system. They can also use this system to schedule individual meetings with a few students for further clarification.

6 ABSTRACT The project named â€•Placement Management Systemâ€–, a student/company information system is a web based system. The project is developed on the basis of â€•III Cellâ€– being presently used in the University for storing and retrieving the information of students and companies who are registered in III Cell.

The goal is to communicate and document the essence of the project, primarily for informational purposes, both within the University and to outside stakeholders. The Low-Risk Project Form provides a template for providing this information. A low-risk project is typically described by a sentence or two of text in each of the sections of the form. The level of detail in this documentation should be agreed upon mutually by the project manager and the project sponsor, with additional input and guidance as appropriate from the key project stakeholders. Medium-Risk Project Documentation Documentation for medium-risk projects should be more detailed than for low-risk projects and the level of detail should be commensurate with the complexity of the project in any case. You are strongly encouraged to use project planning software, e. The project plan should include a Scope Plan, which includes the project objectives and the project deliverables, and which includes at least a simple Work Breakdown Structure. The Resource and Staffing Plan should indicate clearly the resources to be used and should indicate key or required staff. The Communication Strategy should articulate the extent and nature of communications involved in the project. The Budget Plan should be appropriate to the needs of the Project Sponsor. The Security Plan should identify anticipated security issues and indicate how they will be addressed. The Testing Plan should be consistent with the complexity of the project and the associated risks. A Training Plan, if appropriate, should outline plans for training of all anticipated and intended users. High-Risk Project Documentation Documentation for high-risk projects should provide all of the information required to initiate, plan, execute, monitor, and complete the project in a timely and cost-effective manner. A detailed Scope Document should be included that clearly describes the project objectives and the project deliverables. Plans for scope management should be provided and include procedures for change control. The Resource and Staffing Plan should explain what resources people, equipment, materials and what quantities of each should be used to perform project activities, and it should provide a complete account of key or required staff. The Communication Plan should describe the processes required to ensure timely and appropriate generation, collection, dissemination, storage, and ultimate disposition of project information. The Budget Plan should be appropriate to the needs of the Project Sponsor and should provide a complete accounting of costs for staffing, equipment, software, supplies, consulting, and other costs. A life cycle cost or total cost of ownership, projected out at least 5 years, should be included. Chapter 3 : Project Report on Training and Placement Management System in Java Download

Download Java, JSP and MySQL Project on Training and Placement Management System with source code, report, synopsis and documentation. Download Java Project.

The main objective for developing this project is to develop a discussion portal which consists of quiz questions on different subjects. Students who want to take mock tests can use this application. It is a virtual showcase for managing different types of organizations and institutions, academicians, industrialists. The project Quiz Management System will reduce the amount of time spent by the employees of the company and also provides a convenient and efficient means of reaching to persons using cutting-edge-technologies. This application has a good appearance and is very easy to operate. It is very simple and easy to access at Java. It is a very simple source code. It saves our time and money. This project provides a lot of features to manage in very well manner. This project contains a lot of advance modules which makes the back end system very powerful. The main objective for developing this project is to provide advertising facilities. It can help for clients in developing their business by planning, creating handling and advertisement. It also provides time to time current status information about business by advertisement. This project is useful for handling customers information, managing employees details, taking orders.. The main objective for developing this project was to automate the operations of the Hospital. There are lots of operations and functionality done in hospital system, so I developed this project to automate all the functionality and maintain the data accuracy. As per the current scenerio, the data accuracy and the computerization is accepting globally, so this project will give the hospital system a new way to maintain the records. The main objective for developing this project is to provides powerful application designed to allow companies to their human resource works and manager their employees more efficiently. This project has various modules are covered where HR department can update , delete, modify employees details from database and manage employee payment details, work allocation details, off shore details, recruitment information, short listed candidates, project allocation, experience, education details etc. The main objective for developing this project is to provide the information about passenger details, seat availability, price per seat, bill generation and other things. It can help for manages the details of all agent, tickets, rental details, and timing details. The charges are different for different buses. The charges also depend on the distance the customer wants to travel. It also can maintain their facilities. It can keep to record information like schedule and details of each bus. The purpose of the project is to build an application program to reduce the manual work for managing details through internet. An E-Commerce portal which will allow formal and informal merchants in developing countries to advertise and sell their goods on the internet. This would permit rural communities to make their wares available to the rest of the world via the World Wide Web. The objective of this project is to create an e-commerce web portal with a content management system which would allow product information to be updated securely using a mobile device. The web portal will have an online interface in the form of an e-commerce website that will allow users to buy goods from the merchants. There are two types of users available in the project, first one is Customer and second one is Admin. Customers user have limited access right to access the system, while the admin users have full control over the system. It can also managed daily transactions with intake and outgoing data. It also provides time to time current status information related to stock. It can be used to store the details of the inventory, update the inventory based on the sale details, produce receipts for sales, generate sales and inventory reports periodically etc. The purpose of the project is to build an application program to reduce the manual work for managing the stock. The main objective for developing this project is to managing users contact details, phone numbers, and address. There a lots of other features has been added for online address book and one of these is attaching a profile picture for particular contact. The main objective for developing this project is to manage Student details, prospective Students, Student Marks Details, Student Attendance Records and all the Students related data. This system is very useful for schools, colleges and universities.

This project is a student-level data collection system. This project contains a lot of advance modules which makes the back end system very powerful Java Projects on Bug Tracking System Posted on Thursday, May 12, - Bug Tracking System is the system which enables to detect the bugs. It not merely detects the bugs but provides the complete information regarding bugs detected. Bug Tracking System ensures the user of it who needs to know about a provide information regarding the identified bug. Using this no bug will be unfixed in the developed application. The developer develops the project as per customer requirements. In the testing phase the tester will identify the bugs. Whenever the tester encounters number of bugs he adds the bug id and information in the database. The tester reports to both project manager and developer. The bug details in the database table are accessible to both project manager and developer. When a customer puts request or orders for a product to be developed. The project manager is responsible for adding users to Bus Tracking System and assigning projects to the users. The project manager assigns projects to the developers. The developer develops the projects as per customer requirements.

Chapter 4 : Java JSP and MySQL Project on Training and Placement Management System | FreeProjectz

This project Training and Placement Management System has been developed on Java, JSP, and MySQL database. Our website blog.quintoapp.com provides many types of java software projects to be developed as the final year college project for students.
