

**Chapter 1 : Reel Creations - Partners in the Movie, Show and Special Effects Makeup Industry**

*Gordon's kick was good, and Alva led Hennessey was pretty much shut down for the final minutes of the third period, and earned a dead ball personal foul just before time ran out. Fourth Quarter.*

Edison is the fourth most prolific inventor in history, holding 1, US patents in his name, as well as many patents in the United Kingdom, France, and Germany. His first patent was for the electric vote recorder, U. Patent 90, which was granted on June 1, Edison became a telegraph operator after he saved three-year-old Jimmie MacKenzie from being struck by a runaway train. MacKenzie of Mount Clemens, Michigan, was so grateful that he trained Edison as a telegraph operator. In , Edison was working on a machine that would transcribe telegraphic messages through indentations on paper tape, which could later be sent over the telegraph repeatedly. This development led Edison to speculate that a telephone message could also be recorded in a similar fashion. He experimented with a diaphragm which had an embossing point and was held against rapidly-moving paraffin paper. The speaking vibrations made indentations in the paper. The machine had two diaphragm-and-needle units, one for recording, and one for playback. When one would speak into a mouthpiece, the sound vibrations would be indented onto the cylinder by the recording needle in a vertical or hill and dale groove pattern. Edison gave a sketch of the machine to his mechanic, John Kruesi, to build, which Kruesi supposedly did within 30 hours. Edison immediately tested the machine by speaking the nursery rhyme into the mouthpiece, "Mary had a little lamb. Edison took his new invention to the offices of Scientific American in New York City and showed it to staff there. As the December 22, , issue reported, "Mr. Edison recently came into this office, placed a little machine on our desk, turned a crank, and the machine inquired as to our health, asked how we liked the phonograph, informed us that it was very well, and bid us a cordial good night. The Edison Speaking Phonograph Company was established on January 24, , to exploit the new machine by exhibiting it. As a novelty, the machine was an instant success, but was difficult to operate except by experts, and the tin foil would last for only a few playings. A process for mass-producing duplicate wax cylinders was put into effect in The cylinders were molded, rather than engraved by a stylus, and a harder wax was used. The process was referred to as Gold Moulded, because of a gold vapor given off by gold electrodes used in the process. Sub-masters were created from the gold master, and the cylinders were made from these molds. From a single mold, to cylinders could be produced every day. By mid, the savings in mass duplication was reflected in the price for cylinders which had been lowered to 35 cents each. Beveled ends were made on the cylinders to accommodate titles. In response, the Amberol Record was presented in November , which had finer grooves than the two-minute cylinders, and thus, could last as long as 4 minutes. Although Edison began experimenting on the phonograph using wax coated paper as a recording medium, his phonograph recorded sound onto a tinfoil sheet phonograph cylinder. Then at the turn of the century, Emile Berliner initiated the transition from phonograph cylinders to gramophone records: In American English, "phonograph", properly specific to machines made by Edison, was sometimes used in a generic sense as early as the s to include cylinder-playing machines made by others, but it was then considered strictly incorrect to apply it to the upstart Gramophone, a very different machine which played discs. After electronic disc-playing machines started appearing on the market during the second half of the s, usually sharing the same cabinet with a radio receiver, the term "record player" was increasingly favored by users when referring to the device. The brand name Gramophone was not used in the USA after , and the word fell out of use there, though it has survived in its nickname form, Grammy, as the title of the Grammy Awards. The Grammy trophy itself is a small rendering of a gramophone, resembling a Victor disc machine with a taper arm. Edison devices in the Reel2ReelTexas.
