Chapter 1 : SAP EWM Certification Preparation Guide

SAPVITS serves SAP EWM training which makes you expert in warehouse management also providing sap ewm course content with study material. To get the full advantage of SAP Extended Warehouse Management tools and techniques, one needs to delineate the warehouse and characterize its physical structure.

Meanwhile this document is a little bit outdated, as there where changes in EWM which affects this, so I have amended or updated the text below. EWM needs movement data as well, but for this a separate integration model was build. Master Data for EWM transferred through CIF means â€" material, â€" batches if you have material with batches , â€" customers, â€" shipping points and â€" classifications for material with batches. See Picture 1 Note: I will not explain how to work with CIF in general, there is enough documentation about that and there are also some aspects from an administrative side to consider, so this is a different topic. What you have to do when transferring the material you have to flag the field for material and you have to enter selection criteria to select the material see Pic. Whatever selection criteria you use is fine, but rarely you will transfer all materials which would mean to enter no selection criteria , that means you have to give it some thoughts how to select the materials in the most effective way. Next to the flag for material is a flag for plant. When you set this flag, you also should enter a plant in the selection area. This way you do not only define a selection for the material, but also for the plant you transfer. If you would not enter any plant, all plants in your ERP system will be transferred to the EWM system and exist there as location Pic 3. Now the first question is: And not in the same section as the shipping point or the vendor? And the next question is: For this we have to look at the material master. The material consists of several fields, these fields are organized in views. Views describe for which aspects the fields on the view are being used for example sales or accounting and are therefore assigned to the corresponding organizational units like the sales area or the company code. For CIF two groups of fields are relevant: Fields on client level, like the material name, weight, etc. In this transaction you can distinguish between a global data view and a location view Pic 4. The global view which is then simply the product corresponds to the data on client level in ERP, while the location view, also called a location product, which requires that you enter a location as well, shows the information which is maintained on the MRP views, that means it always refers to a plant. The important thing when you use EWM is: So you can reduce the data which is being transferred to the EWM system significantly if you choose to transfer the client level data only. The question is how to do that. First of course you do not mark the plant to be transferred. Still you can enter a plant as selection criteria for the material, this way only materials for which views referring to this plant are defined, are transferred. This field is a marker for CIF that the target system is an EWM system and that no plant data of the material master is to be transferred. If you have still marked the plant to be transferred and entered a plant as selection criteria, this plant will be transferred and a location will be created â€" but no location product. In order to select anything here, you have to maintain the mapping of the ERP warehouse number to an EWM warehouse number. This is a separate table in customizing. Actually it does not matter what you enter in this table, it is not checked if this really is a warehouse number in EWM or not but for consistency I would recommend to maintain this properly. It also does not matter if you have more than one EWM warehouse in which the material is stored, you only transfer the material master once, the product is then working in all warehouses in that EWM system. So you can select any warehouse number which is maintained in this table. That means that if you want to use this feature of transferring the GR block from ERP, you must NOT enter the warehouse number in the selection screen. But wait, there is something else. If you use WM and want to store the material in a warehouse, you have to have the views maintained, otherwise you will get an error message. For example when trying to post a GR for a plant and storage location combination which is connected to a warehouse number, the system will come back with an error message, saying that the material does not exist in the warehouse number, if these views are not maintained. You extend the product by additional information, and this information refers to a warehouse number and a party entitled to dispose. The new transaction is only important for EWM customers. But the real important difference between the WM views and the warehouse product is: EWM can work with the product only. You

only need a warehouse product if there is something in the warehouse you want to control through the product. There are a lot of things you can control through the product like the storage type sequence for putaway or picking, or the storage section sequence, or the determination of the warehouse process type â€" but putaway and picking and most processes are possible without a warehouse product. So it should always be considered if you really need a warehouse product. If only 20 or 30 percent of the products are in any way using a field of the warehouse product â€" it means that 70 or 80 percent of the products do not need a warehouse product, and that is a lot of master data which does not need to be maintained. What possibilities are there if you want to have a warehouse product or if you need one as you want to control processes in the warehouse through the product? But this means that all the control flags like the putaway control indicator or the section indicator have to be the same in your EWM warehouse number as you used them in WM. Personally I find both methodsâ€¦ questionable. OK, it is nice for a quick move over from WM to EWM â€" but why do you change if you do the same things as before anyway? And my absolutely nightmare is that customers continue to maintain WM viewsâ€¦ â€" A nice way to create the warehouse product is the use of slotting http: You do not have to make use of all the possibilities available in slotting, but what slotting will do is that it will create a warehouse product in case none does exist. And so you can use very simple condition records in order to get your warehouse products created and certain information filled. Slotting can not fill all fields available in the warehouse products, but once the warehouse product exists, you also can do a mass change after that. If up to now you have a procedure build to create the WM views meaning you use a workflow or any other method to have users maintaining master data , you can consider adapting this procedure for the maintenance of the warehouse product, but it should be extended by the question if a warehouse product is really required. The reason for this flag is the QM goods receipt control which is available since that release.
